> right..?
>
> Thanks,

Larry::::
I have a PRO-51 with a date code of 7A4. This seems to be the LAST
date coded model that can take the keyboard mod as I have tried it on
later models with NO success.

Try this: (1) First try hold LOCK-OUT, 2 and 9 keys down while turning on
power. Test frequencies should be loaded into the first 25 channels (maybe) .
If channel 23 contains a magic frequency (888.96MHz) then you can direct
search .
****
(2) IF that does NOT work (THIS WILL !!!!!) hold down BAND, 2 and 9 down
while
turning ON power. Now, in the digit test mode, all digits of the LCD will
move slowly
from the left to the right of the display.

(3) When the movement advances nearly to the right end of the display, press
and hold
the LOCK-OUT, 2 and 9 keys until the digit test mode stops...
The display will blink, **NOW** the radio will begin scanning the
factory-preset frequencies.
Manually step to channel 23, which will display 888.960 MHz, roughly the
middle ofthe
cellular band. Start a normal, direct search routine from this frequency to
cover thecellular
freq's.

(NOTE) This will wipe out all stored frequencies. You will want to keep CH #
23 open ,so
you can do your searches up or down from 888.960. Once you search higher than
896.000,
or lower than 869.000 , you will need to manually step to CH # 23 again.
(once yousearch

past those ranges you need to go back to the middle by going to ch. 23)

After you get the mod complete it is safe to program the scanner back to wherever you had
it, just keep ch. 23 open for cell.

Hope this was not too confusing. HAPPY SCANNING!! |-))))))))))
{for more info, see Monitoring Times Dec. 1994 Pg.112}

(NOTE) This will wipe out all stored frequencies

4633. Re: Listening to a freq without storing

Michael R. Erb <erb@baka.com> wrote:

>Having just purchased my first scanner (a UBC3000xlt)
> I am puzzled by the
>apparent inability to specify a frequency to listen to without the
>necessity of "storing" it in a channel first....

I usually use the highest channel as a place to store
a frequency of temporary interest. That's channel 400
in the case of the BC3000XLT.

If you wanted to avoid storing the frequency in a conventional
memory channel at all costs, you could store it as a search limit
instead.

Some of the newer Radio Shack models are equipped with
a DIRECT key. You can open the squelch, enter the frequency digits,
press DIRECT, then press MONITOR, to store it in a monitor
channel.

Well I have a new toy !

I thought I'd post something of use,
instead of getting involved in the local flame wars.

Welz WS1000E Wide Band Receiver Specifications

Reference: Owners Manual

Freq range .5MHz - 1299Mhz
Speaker Impedance 8 ohms
Antenna Impedance 50 ohms
Antenna Connector BNC
Freq Step 1,5,6.25,9,10,12.5,15,20,25,30,50,100kHz or Auto
Memory 400 channels
Search band memory 10 channels
Search pass memory 80 channels
Operating voltage 2.2 - 3.5 VDC
Rated voltage 3.0 VDC
Battery 2 AA / Alkaline
Current Consumption Receiving Approx 125mA (AF OUT 60mW 8 ohms)
Waiting Approx 65mA
Battery save 1 sec 16mA

Dimmensions 58 x 97 x 24mm
Weight 200g total
Operating temperature -10C to 60C

Receiver

Reception type A3E(AM) F3E(WFM/FM)

Sensitivity

0.5MHz to 5MHz AM 1.5uV (10dB S/N)

5MHz to 160 MHz AM 1.0uV (10dB S/N)
FM .5uV (12dB SINAD)
WFM .7uV (12dB SINAD)

160MHz to 370MHz AM 1.0uV (10dB S/N)
FM .7uV (12dB SINAD)
WFM 1.0uV (12dB SINAD)

370MHz to 520MHz FM .5uV (12dB SINAD)
WFM 1.0uV (12dB SINAD)

520MHz to 1300MHz FM 1.0uV (12dB SINAD)
WFM 1.0uV (12dB SINAD)

Audio out Approx 90mW (8 ohms, 10% distortion)

Made by Diamond Antenna Corporation
15-1 , 1-Chome Sugamo Toshima-ku,
Tokyo Japan TEL. 03-3947-1411 FAX 03-3944-2981

==========

First opinions:

Overall - everyones gotta have one !!
look and feel - SMALL , Solid , well constructed
sound quality - small sounding , but clear and crisp
- also has optional spk jack
w/headphones - sounds crisp , loud , clear
buttons - really really small ! two vertial lines of about 6 keys a line
programming - I haven't figured it all out yet.
This radio does alot !
receiving - 150MHz range nominal
800MHz range nominal
below 150 ? above 800 ?

Compared to R1

R1 seems more rugged.
Size - 1/2 the size of a pack of smokes.
WS uses AA batteries !!
Sound quality - R1 was slightly better.
Cost - about equal.

As far as side by side .... I sold my R1 about a year ago so ....

I liked my R1

I like my WS1000

4636. HELP!!!! Alinco DJ-191E

Please ......help me.......

Need a mod for my Alinco DJ-191E or keypad operations for opening it for
extended RX.....

Please E-mail: larsin@namdalsnett.no if you have the answer:-)

4637. CHEEK engineering rocket scientist extraordinaire

Newsgroup: rec.radio.scanner
Date: 1996-09-13 00:00:00 UTC
From: ronkatz@interlog.com
Message-ID: <3238efeb.468022@news.interlog.com>
Source record: 223266

Some history to remember.

How to address Bill

>"Scannist Extraordinaire" 9/1/96

Why? because he said it best when he told us all that..

>"I -=AM=- a 30+ year telecommunications and electronic engineer,
>you horse's ass," 8/6/96

>"You may infer that I am an engineer and a
>professional......33-years worth, at last count.
>And I can spell, too! " 7/19/96

>"I even do a little rocket science once in a while" 7/19/96

How about drugs? do you do that also?

He is known to have developed hi-tec mods for scanners, made great
leaps and bounds in scanning technology, really made some wild
contributions to this newsgroup. He has even written a few books.

>" I got publishers yanking on me from one side and hackers on
>the other. About every couple of years, I just have to give
>in and crank out another one" 7/19/96

Are you sure your not doing any of the "yanking" bill?

What a great guy eh!

>"English is my native language, and I am a relative
> master at it, too." 7/21/96

Yup, The man is a walking library of knowledge.

> read my book, I have years of knowledge packed into a few pages.
>8/8/96

Why not put it all into one 8 1/2 X 11" I'm sure it will fit..

>"is was loaded with VALUE and information." 7/22/96

must have taken you a long time eh?

Most of all he is very kind and gentile man. His kind words inspire us
all.

so remember...
> "Stick a sock in it..." 7/30/96

Let Billy have the last word or find out

>"that gap between your buck teeth makes you whistle when you talk" 7/31/96

and you may sound like

> "You are one utterly stupid nincompoop" 12/19/96

or possibly

>You are one stupid, dumb, ignorant dung-fer-brained idiot." 9/11/96

or maybe even

> Then you are a fucking idiot. 9/13/96

If you still don't understand

>Then you are worse than a fucking idiot." 9/13/96

and

>"You are nothing but a pissant" 8/15/96

But remember...

>"for those who attack my education, profession, art, science, and
>technology, well hell..... they can put up or shut up.
>And I aim to return their challenges until they do." 8/6/96

Ok, go ahead Willy, It's your turn.
Oh, but wait, did you not say...

> "I do not feel it necessary
>to defend myself to lowly pissants." 8/31/96

Remember Bill you said it best on 7/21/96
> "Yep......Asshole is my middle name."

Somehow I think you have more then one middle name......

Hello,
Are there many British subscribers to this Newsgroup ?
I'm looking to purchase an outdoors Civil Airband specific
antenna.
Does anyone have much experience with the 'Sandpiper' 'FGA
Collinear' ?
It's described as an "high quality fibre glass encased aerial of
3db gain".
I don't know much of the technicalities of radio, but 'am looking
to improve my reception of local ground broadcasts (quality
variable, in some cases barely discernible in thr background
noise - squelch virtually off).
The receiver I'm using is a 'Netset' Pro-44.
Any Lowe 'Airmaster' users out there?
Please E-mail any advice on the 'Sandpiper' direct to me.

>News:Police radio hacker convicted

From the article it seems clear that this man did violate the law. As I understand the article he used information not available to the public and hacked, Motorola software to program the radio. The secret stuff the newspaper article refers to is not the talkgroup and other information necessary to follow users of the system, it is the passwords and software used to control the trunking system.

How Motorola is getting these people is because they are violating Motorola's license and copyright by illegally copying and then modifying their software. You must currently have the Motorola software in order to program the Motorola radios, along with a password stolen from the police agency. In order to get both, you must violate several laws. You also violate the law because, like cellular telephones, even radios that are just used to receive transmissions occasionally transmit data on the system - so by having the radio you become an unlicensed/unauthorized user of the system.

What must be understood is that everything necessary to follow conversations is transmitted in the clear over the data channel. If someone develops their own demodulator and software to interpret the data channel, and does not voilate Motorola's trade secrets by marketing the device and software, in my opinion they would violate no law. The software could even be setup to capture all new talkgroups as it "hears" them and over time the user could then identify what people/groups use what talkgroups, just as we now track frequencies. Such hardware and software would also be immune to the shutdown instructions some departments are now starting to routinely transmit for unused radios.

4642. P L E A S E Recommend VHF/UHF scanner

Newsgroup: rec.radio.scanner
Date: 1996-09-13 00:00:00 UTC
From: Miro.Ivankovic@guest.arnes.si
Message-ID: <76k+5d2yuoNo@stenar.arnes.si>
Source record: 223271

Hello,

I am looking for the 'best choice' of the VHF/UHF (incl. Air)
handheld scanners. Could someone give me any advice on this.

However, I don't care about HF (SSB...) but I want a good perfor-
mance nearby 100-500 MHz (AM/NFM) and above.

Generally, all requirements are: good VHF/UHF and AirBand, high
level audio output and maybe standard batt. size - 'AA'

Thanks, in advance, for the help and any information.

Miro Ivankovic

>Actually, we do have it good here. Sure, our dollar isn't strong
>compared to yours, but it still buys a dollar's worth of goods in our
>own country. Sure we have the GST. Small price to pay for everything
>we get.

Paying an additional 7% on the price of everything you buy (on top of HUGE provincial sales taxes of 8-9%) is a "small price?" Apparently, quite a few Canadians would disagree with you. My grandparents live near Grand Forks, North Dakota. On the weekends, it's almost impossible to shop at the stores there because of the large numbers of people that drive down from Winnipeg to take advantage of the lower prices, larger selection, and significantly lower taxes that are available there. Even the amount of gasoline they burn on the 200+ mile round-trip is offset by the fact that they can fill up on the US side of the border for substantially less.

> Imagine. Medical care for EVERYONE!

Yeah. Socialized medicine, in other words. As in waiting lists for operations, poor service, "revolving-door" hospitals, etc. If your system is so great, why is it that those affluent Canadians who can afford to do so routinely elect to come to the US for their medical care?

>Education that puts yours to shame.

You also have a much more homogenous society than we do. Without getting into racial confrontation, it is a proven fact that average test scores are much higher among whites vs blacks and Hispanics. The relatively high number of minorities in this country, as oposed to Canada, brings down the average.

>Not to mention, we're the number one country in the world (officially!)
and >have been for a number of years.

Huh? By what standards? Number one in WHAT? Socialism and high taxes?

>Canada is recognized around the world as a peaceful country and a
>protector of

>peace (we came up with the idea of the U.N. Peacekeepers and have been
>part of that team from the beginning). You're only known for your
>violence and your blood lust for war.

What other choice do you have? Canada lacks a powerful, sophisticated military. Your only option is to be "nice" and "peaceful" to the rest of the world and hope that nobody attacks you. But of course if they did, the "violent, blood-lusting" Americans would be quick to bail you out with our superior military.

-Drew in Sunny Central Florida-

Turn a measly $5 into $50,000!

Taking 5 minutes to read this text may be one of the best decisions
you ever made.

I could make $50 000 within 4 weeks for an investment of only $5. I
thought it was a huge joke! I spoke to my friends about it and they
thought likewise. But after three days of desperate struggle I
decided
I had nothing to lose. My family and I sent $1 by snail mail to each
of 5 names and addresses specified in the article. We then placed our
own name and address in the article and posted it in 200 other
newsgroups.
Two weeks later, I started receiving money in the mail! I could not
believe it! Hundreds of dollars turned into thousands, and in the 4
weeks, I received a total of $53,654. It came from all over the
world.
If you follow the 3 steps below, there is no reason whatsoever why
the
same shouldn't happen to you. This is a perfectly legitimate
investment
opportunity. You invest $5 and you receive a return on your
investment.
So does the next investor. NOT ILLEGAL, NOT A CHAIN LETTER -
PERFECTLY
LEGITIMATE!

OBVIOUSLY, IF YOU ARE NOT INTERESTED, THEN DON'T PARTICIPATE. BUT
PLEASE PRINT THIS ARTICLE AND GIVE IT TO SOMEONE WHO MAY WISH TO TAKE
ADVANTAGE.

The procedure is very simple.

STEP 1. Write your name and address on 5 separate pieces of paper
with
the words "PLEASE ADD ME TO YOUR MAILING LIST". Fold a $1 note
in each of the pieces of paper and mail them to the
following five addresses:
****

1. Peter J. Boe 14817 Holden Circle, Portland OR, 79927

2. P. J. Boe 14817 Holden Circle, Portland OR, 79927

3. Dusty Cole, 804 Cass St #703, La Crosse, WI, 54601

4. Mr. P. Boe 14817 Holden Circle, Portland OR, 79927

5. Barbie Doll, 38 Birkdale St, Dollard des Ormeaux , Quebec, H9G
2P3, Canada

****

STEP 2. Now remove the 1st name on the list, move the other 4 names up
(5 becomes 4, 4 becomes 3 etc) and put your name and address as number
5 on the list. You can do this by re-typing this article or simply
editing and re-posting it in this or another newsgroup.

STEP 3. Post your amended article to at least 200 new groups (there
are
17 000 of them).

You are now in the Mail Order Investment Business and you will start
receiving $1 returns by mail within a week or two. The more
newsgroups
you post to, the bigger your return will be. You may want to rent a
Post Office Box to handle the volume of mail you are likely to
receive.
If you wish to remain anonymous, you can use a pseudonym such as
"The Manager" or "The Investor", but make sure your address is
correct!

NOW LET ME TELL YOU WHY THIS SYSTEM WORKS!

Of every 200 postings I made, I received an average of 5 replies, YES
-
ONLY 5, each with a $1 bill enclosed. You make $5 for every 200
postings WITH YOUR NAME AT NUMBER 5.

Each person who sent you $1, now also makes let's say,only 200
additional postings WITH YOUR NAME AT NUMBER 4, i.e. 1000 postings.
On average therefore, 50 people will send you $1 with your name at
number 4. You make $50.

Your 50 new agents make 200 posting each WITH YOUR NAME AT NUMBER 3
or 10 000 postings - average return 500 at $1 each is $500. They
make 200 postings each WITH YOUR NAME AT NUMBER 2 = 100 000 postings
= 5 000 returns at $1 each = $5 000.

Finally, 5 000 people make 200 postings each WITH YOUR NAME AT NUMBER
1
and you get a return of $50 000 before you name drops off the list.
AND THAT'S IF EVERYONE DOWN THE LINE ONLY MAKES 200 POSTINGS! Total
income in one cycle = $55 500.

From time to time, when your name is no longer on the list, you take
the latest posting that is appearing in the newsgroups, SEND OUT
ANOTHER $5 TO THE NAMES THAT ARE ON THE LIST, PUT YOUR NAME IN
AT NUMBER 5 AND START POSTING AGAIN. Remember, 200 postings is only
a guideline. The more you post, the greater the return.

Let's review the reasons why you should do this: THE ONLY COST
FACTORS

ARE 5 STAMPS, 5 ENVELOPES, AND 5 $1 BILLS. Anyone can afford five dollars to put into such an effortless investment with SPECTACULAR RETURNS.

Some people have said to me "What happens if the scheme is 'played out' and no one sends me any money"? Big deal! So you lose $5 - but what are the chances of that happening?

Do you realise how many Internet Users there are? Do you realise how many times this scheme can be utilised over and over again - with COMPLETELY NEW people participating?

There are not HUNDREDS, NOT EVEN THOUSANDS, BUT HUNDREDS OF THOUSANDS OF NEW INTERNET USERS EVERY MONTH!

Remember, read the instructions carefully and play FAIRLY...that's the only way this will work. Get a printout so you can refer back to this article easily.

Try to keep a list of everyone that sends you money and always keep an eye on the newsgroup postings to make sure everyone is playing fairly. You know where your name should be.

Take it back!

I have a CUB and it is awsome.....I figure the scout is 2x better.
Now if you are trying to read a Cordless phone, then you will only get a reading about 3 inches away but VHF, UHF and 800 MHZ will read alot further!
I can capture VHF about 20 to 40 feet away at 2 watts
UHF, 30 to 70 feet away at 2 watts
800 MHZ (with the right antenna) up to 80 YARDS on a bag phone or mobile!

Now, I do have different antennas......you have to have the right antenna for the right frequency. Dont expect to pick up a CB 50 feet away with a 800MHZ antenna.

Genneral rule: The lower the freq the closer you have to be.(depends on wattage)

Hope this helps.

Hi Aaron,

you may want to check out the following WEB site:

http://student-www.eng.hawaii.edu/carina/nascarscannerfrequencies.html

It contains a list of Winston Cup frequencies which are updated on a
weekly basis. I found this list of be pretty accurated back in August
when I attended the Winston Cup race in Watkins Glen, NY.

How about all you guys and gals that work in and around Federal facilities; Post Offices, Federal buildings, DOE plants, VA centers, EPA centers, you get the idea, post some of the freqs being used in your areas. Some of the data out there is getting old, and different freqs are be added and some dropped.

I work at the Post Office Annex (distribution facility) in Cincinnati. Here's a list of what I have for us.

163.3750 USPS Mechanics (hasn't been used in awhile)
166.3500 / 162.2250 USPS Postal Vehicle Service
169.5750 USPS maint. supervisors
410.0000 USPS Operations
410.325 / 414.7250 USPS operations
414.750 / 407.7750 USPS PIS Ch.7
415.050 USPS Operations
418.3000 USPS PIS (old postal police freq)

That's right. Although most PDs know they're being listened to, they don't want people walking up to them and just asking them for the 10 codes. They use them to obscure their transmissions on purpose otherwise they'd speak "in the clear." If I knew that one of the people on the force was a ham, I would ask him though.

They don't shoot us, either. Why? Because here in Florida, we have the right to carry concealed weapons, and we shoot back! The criminals know the residents are armed...that's why they pray on foreign tourists from places like Canada with strict, socialistic gun control laws! <g>

Well you can get the AOR part from a mail order outfit about $89.. Or
you can pick up the OPTILYNX from OPTOELECTRONICS for about $129.
Or build your own for around $10... Check out the links below for
info..

OPTOELECTRONICS

: and I was wondering if I could use it. Thanks for the help

RG-213 and RG-214 are some of the best grade 50ohm coaxial
cable you can get, its not cheep stuff thats for sure. You lucked out
getting this stuff. It goes about 45 cents more than regualr RG-8
or RG-8x... The mil-spec on it means that it is corossive fighting
much harder to ruin, it will handle the weather better than other
brands of cable.. The person who gave it to you knew what to give you
it will work just fine in all of those bands, transmitting too.

> for either in the Los Angeles area, or elsewhere in the US? Thanks.

You need to use an interface made for the 2700. Try the following:

EEB in VA has the INF8000 interface $89
CAT in LA has the Uni-Versatile interface $99
OPTO in FL has the OPTOLINX for $126

all of the above advertise in Popular Communications Mag.

Or you can build your own from a single MAX232 or MAX233 IC chip for
about $15 if you are handy with stuff like that.

Good Luck

Nick

Try using different antennas for the band you wish to concentrate on. My Scout picks up the local prison repeater and I am about 1/4 mile away. I use a VHF rubber duck. For uhs I use the DB-32 antenna but range is limited. I will probably make or buy an antenna for the 460 range. For 800 mhz I use a cellular bagphone ant with adapter to the Scout BNC.

THe Opto DB-32 antenna is for very very close work. I havn't picked up much of anything using it except some 900mhz stuff.

Good luck

Nick

>The other evening I noticed TV audio on 44.340MHz. Anyone have any clues
>to what equipment is transmitting this audio?

The TV station. :-)

Its appearance is probably due to front-end overload of your scanner,
resulting on an odd mixing product that looks like a signal in the wrong
band.

FWIW my AR-8000 gets Channel 2 audio at the top of the cordless phone
band.

You don't wish for much do you? I sure hope this isn't your first project or you are new at building things. A scanner is not an easy first project. From my own personal experience, if you are building a scanner to evade paying for an expensive one, you might as well buy a brand new top of the line scanner. It's not an easy trick and it will be very time and money consuming. BUT, if you really want to build one, I suppose you could get the service manual for one and order all of the parts. (that's kind of rediculous, but I guess you could do it) Building one from scratch is pretty much out of the question unless you do it for a living and have access to motorolla or something like that. 800 MHz is not something that can be done on a breadboard. tyler

Like I said before, with most of their packaging, it's pretty difficult to tell. They don't tape or seal the boxes shut, like others do. I believe they do it this way just to make it easier to resell returned items.

4698. Pro-60 vs BC3000XLT (Newbie question)

Newsgroup: rec.radio.scanner
Date: 1996-09-13 00:00:00 UTC
From: tropic@ruislip.East.Sun.COM
Message-ID: <51btbg$co8@walters.East.Sun.COM>
Source record: 223327

I'm new to this game. In looking around, reading this newsgroup
and visiting stores, the machine I've come down on is the
BC3000XLT.

I've seen it advertised for about $350 (US) delivered.

Radio Shack are currently offering the Pro-60 on sale
right now (at least here in New Hampshire) for $250.

On the face of it, the machines seem reasonably similar,
although the 3000 has the clear edge in one or two areas.

My question(s) then - is the BC3000 worth the $100 more over
the Pro-60? Can the BC3000 be had at a lower price?

Thanks,
Gary

To the plug-guy:alexander

I reviewed my post about your lack of.....and stand by it still.
Plus the Hansen-guy who also said similar as to your "child-like"
protrusion into this group...very undeveloped.

People who read your drivel see what you are missing and then just
bypass the banality which your present age gives you. Your points
are dull. Your "i dare you's" very much a sign of porridge-itis.
That being that your mother feeds you still.

Again, you just don't get it. You just see the mirror-image you
help create for company.

When you see ... maybe you will be forced to understand.

what I said in that last post stands still. Along with others
who agree.

Get real Mikey. In the last couple of months my only "bitch and wine" has been
in reply to you brother John Mackey's lies with my name attached and one reply to
your constant childish posts.

> Hey guys, if you don't want to read my drivel,

At least you call it what it is.....

> why don't you use
> the delete key (all you do is take the finger out of your nose and poke
> the keyboard--you'll eventually find it)?

Do you always assume people have your talents?

> Better yet, why don't you show me the error of my ways

I did Mikey. To recap, You have really impressed me the
last week or so with your "or shut the hell up" posts. How many times now
have you posted that drivel of yours? I think you have beat the record of the
idiot that responded to everyone that he was adding them to their kill file.

>and post something worthwhile? Naw, I guess not.
> Never have. Never will.

I have Mikey. Guess you were spending too much time telling people to
"shut the hell up", playing price police and campaigning for moderator
to have noticed. Maybe you have spent too much time flaming others
to really see what is going on? Your record stands on its own Mikey,
spew me some more of your childish crap. You are nothing but a tiny
boy with an over inflated ego showing the Usenet what a hypocrite you
really are. You are doing exactly what you flamed others for doing.

: thanks. tyler

Apart from the fact the US citizens shouldn't be doing this, I've heard
there are ROM programs which you can program into an OKI-900 which will
make it follow calls as they switch from cell to cell. You can't snarf
(pick up ESN/MIN) because the cellphone is not capable of receiving the
reverse (phone to tower) frequencies, but the handoff commands are on the
forward channels and can be decoded/received by the hacked phone. You need
to burn a 27C512 EEPROM and replace the existing one in the phone, the
programs float around on the hack/phreak sites.

> Two possibilities.

Does your scanner have a MONITOR button? Many do now, and it is designed to do exactly what you
are talkingabout. If it does have one, read your manual to learn how to use it.

The other option is to use a very limited SEARCH to select just the frequency you want to hear
without entering it into memory.

Most people just reserve one channel in the scanner for this kind of listening. For me, it is the
last channel in the scanner.

Well, if the data is digital (and isn't all data?), then you are not going to pick up anything meaningful with a scanner. No doubt, wily hackers, the NSA and other people know how to capture and decode the data using computers, specialized modems and the like, but it is not something the average Joe with a scanner is going to do.

You can also hook up a scanner to a satellite dish system and grab long-distance (analog) phone calls that are bounced off satellites but again, that is not something the typical scanner hobbyist is going to do. There's a book, Hidden Secrets of Satellite TV (I believe) that describes how you go about hooking up a scanner to do this.

Sitting outside of your home with a Van Eck antenna and capturing images radiated from a CRT is an entirely different thing and has nothing to do with scanners. The CRT gives off electromagnetic radiation, including the images displayed on screen, that can be captured with about $200 in parts from a Radio Shack. I saw one demonstrated at a computer show a few years ago--the captured image was taken from a CRT using a Van Eck antenna and then displayed on a B&W TV set. Apparently this is a favorite tool of the ex-Cold War spies who are now engaged in economic espionage--apparently, they'll drive a specially equipped van into a parking lot of the building occupied by high-tech and other companies--whatever company that has technology worth copying--and attempt to get a look at what is going on on computer screens inside. I don't know if it's true--no one has been caught at it, as far as I know, but it is apparently a common thing.

It's appearance could also be due to a band opening
across the Atlantic Ocean. TV allocations are different in
Europe and many East Coast hams listen for the TV sync
buzz sound from European stations to know when 10 meters
is opening up.

>the performance of my 2004? The radio 'seems' to be fine but I am curious
>as to you opinion if it is worth the effort to open up the radio and check
>it.

Look at it this way.......that 10 MHz reference signal is the basis
for almost everything that is received by the scanner. It is
multiplied through the PLL/VCO section to derive the L.O. injection
frequencies, all of which are above 500 MHz. The L.O. ranges are
559-563 MHz; 636-1130 MHz; and 1368-1980 MHz. So as an example of the
effect, let's say X-301 is off by as little as 20 Hz:

Then a given L.O. freq that's supposed to be at 1500 MHz will actually
be at: (1,500,000,000)(20)/10,000,000 = 3000 Hz (error) A 40 Hz
error at 10 MHz multiplies to a 6 kHz error at the L.O. freq. You
could start missing signals at a 6 kHz error. But even a 3 kHz error
will make some signals "clip" as their NFM deviation exceeds the

bandpass limits of the IF filter. A lot of people complain of this "clipping" effect in the cellular and SMR bands. Some of that is due to the base sites being "off freq" and it can be compounded when the scanner is off freq in the opposite direction.

It's definitely worth a check. The check is almost "free". Just pull the case of the scanner; pop the PLL compartment lid; and touch a wire to Pin 14 of the MC145158 and you'll instantly "feel and hear" any possible problems. A few trial adjustments of X-301 will clue you to what's good and what's bad.

Here is one cool thing you can do that's pretty slick and wicked, too! Solder a .01-uF capacitor to Pin 14 of the MC145158 chip. Solder the center conductor of a mini coax to the free lead of the capacitor. KEEP ALL LEADS SHORT!! Solder the shield of the mini coax to PLL compartment ground. Replace the PLL compartment lid with a notch trimmed out of it to accommodate exit of the mini coax.

Now install a chassis-style BNC jack (just like the antenna jack) on the rear panel of the scanner in a convenient place. Solder the center conductor of the mini coax to the center lug of this BNC jack. Then solder the shield of the mini coax to the ground lug of the BNC jack.

Voile! Now, not only can you quickly test the precision of X-301 at any time you want from there on out (just stick a 3" wire in the center hole and fire up the SW receiver!), but you also have a PRECISE lab-grade source of 10 MHz readily available for calibrating hobby grade frequency counters; receiver displays; and anything else that needs an accurate test frequency. First compare it to WWV as described in my previous articles, and then if within tolerance, inject it into a freq counter, and adjust the time base of the counter so that it reads 10 MHz.

X-301 is a very stable and precise TCXO....expensive, too. And I have seen them stay rock-solid and right on frequency for years. However, quartz crystals do "age" over the years, and there is a fair probability yours is off by 20-50 Hz now. Your PRO-2004 is a good ten years old, and it's time to check and maybe reset that Master Oscillator. The check is easy, and the adjustment is just as easy with the right screwdriver.

Let me know how you make out there.

>>>the capacitance while the tool is near.

>>In this case, it doesn't matter. Period.

>Again why not? Where do you come up with this Rocket Scientist idea?
>CB mods 101 ??!!

The hot side of the capacitor is on the plane of the tiny circuit
board inside X-301. The screwdriver contacts only the rotor which is
the ground side of the capacitor.

>Knock Knock, anyone home? you do not use a metallic screwdriver
>ANYTIME for any oscillator adjustments.

Oh yes I do....under many conditions. And X-301 is one. If anything
else is used, there is a grave risk of damaging the trimmer
adjustment. My article explains the basis for that. Read it.

> No point in repeating myself here because you just don't

Yes, just reserve channel 400 as your "scratch" channel and lock it
out of searches. You could also use the limit scan and manually
UP/DOWN to your frequency of choice, but this would be more of a
bother than using a scratch channel.

>This is bewildering because assume for a moment that I have freqencies

>something I'm overlooking here, or is this the way it is, period?

400 is a round number. Would you not have bought the unit if it only
supplied 399 channels? Just pretend it gave you 399 and use the 400th
as a scratch register for entry of a frequency you wish to monitor on
a temporary basis.

>Best as I can figure out, the only way to listen to a frequency is to
>"enter" it into an empty channel or overwrite a frequency in a channel. Of
>course the other problem is finding an empty channel quickly. How do you
>accomplish that unless you have a log of channel allocation?

With 400 channels and no alphanumeric designators on screen, you won't
get far without a log of channel allocation. In order to know what
your listening to when it stops on channel 263 you would need to have
some reference sheet handy (unless you have a *very* good memory and
then you wouldn't need the allocation chart to figure out what is an
unused channel). I bet most people keep a good log of what's stored
in their scanners. Especially true with multiple hundereds of
channels. Simply use Excel, Access, Works or some other simple
program and keep the list up to date. You could accomplish the same
thing with a piece of paper and pencil, but it's easier on a computer.

>Inquiring minds want to know.

That's a good sign.

BTW, good choice on your scanner. The 3000's a nice unit, IMHO.

Take care,

Dave Bernazzani

Gee, , , , You have a real problem there. But at least you are
thinking the right way, , , , CHEAT!!! :-} You might try an old TV
antenna with the longer elements removed, and polarized vertically.
This could be put in the attic. Don't get a discone, , , they don't
have any gain, and what you need is GAIN ! Try a RS "scanner
antenna". It's basically a two meter ground plane. I find it works
great. You might even try a two meter, four element beam from AES.

Most of the contact reports seem to always be in the 260-264 Mhz range in NFM and WFM. There also have been contacts reported around 249-251 Mhz.

Don't expect to hear much, its mostly digital or data burst, but every once in a while, someone reports hearing clear voice transmissions.

Your setup should be fine. That's a top notch radio and antenna.

Good hunting!

little higher price as long as I make it home to use the goods.

4724. frequencies for Portland and Gresham

Newsgroup: rec.radio.scanner
Date: 1996-09-13 00:00:00 UTC
From: ericp@teleport.com
Message-ID: <51adv2$k1s@nadine.teleport.com>
Source record: 223387

Hello. Can anyone tell me where I could get hold of a directory of the frequencies
for Portland, Oregon and Gresham.
Gresham is a suburb of Portland so the same frequencies should bwepicked up in both areas.
I have a realistic pro-57 and I want to pick up frequencies for the amateurs, transportation services, and aircraft.
Can anyone recommend me to a resource where I can get hold of these frequencies?
Please send your replies to ericp@teleport.com.
Thank you.

>there must be doing it, now if they'll post the info for us.

I'd really appreciate that. Specifically, I have an audiovox sp-95. I have a scanner that can listen to cell phones, but I like to tinker too. I have the programming info for the phone. It is activated, I just don't have an account with the local provider. It comes up on screen as "roam."

>
>I don't know if you can use a non-activated CP for a scanner. Taking one
>apart and reworking it sounds like a lot of work. There are plenty of

Nevertheless, the term "Voice Frequency" is...ummmm....correct.

>A 1000 Hz electromagnetic signal can not be heard with the ear

Ummmmm, get in close proximity to one of those million-watt Navy ELF
stations, and you can sometimes hear it in the fillings of your teeth.

> just as a 100 kHz acoustic signal can not be
>picked up on a VLF receiver. The two are completely different as far
>as what one uses to produce and detect signals within each medium.

All that is true, but the spectrum still retains that monicker for
whatever reasons deemed righteous nad proper by the world bodies that
subscribe to and promulgate it.

The key property here is the decade increments. And 300 Hz - 3 kHz
has to be called something. Used to be, high power transmitters
avoided this band for the very reason of making people go crazy for
"hearing things", which most assurredly can happen when a 1 kHz RF
signal is rectified by teeth fillings, pacemakers, steel pins in
joints & bones, etc.

Anyway, I know it's weird. But that's what it's called.

>This must be your normal state of mind for making technical
>decisions, eh? You certainly couldn't say all you do in a
>lucid state.

You first started with others and lost. Now you want a go at me?

I responded with ZZZZzzzzzzz..... Because your reply did not deserve a response. It would be a waste of time. It added nothing and almost put me to sleep.

You do the same with others and have lost before like you will and have already with me.

Glenn my Wonder Child, You still miss the point. If you want to get back to the technical side and drop the Cheek argument then we will. I'll still prove you wrong.

You disputed my reasoning for NOT using metal tools when making precision alignment on a oscillator circuit. Remember? (probably not)

You still fail to back up your views. Your only defense was On 9/14/96 you said...

>"This thread has been your on going refusal to admit you were
>wrong, Bill's procedure was right. "

How can I argue with someone who can not support their side but instead uses others to press on anyways.

Yes this thread has been going on.

I do not refuse to admit WHEN I'm wrong. Just YOU have failed to show me that I am wrong. You only say that Bill's procedure was right. Children fight this way. Are you a child?

Yes the procedure was right, but the choice of tools is wrong. I said why. What do you not understand Glenn? Maybe I can help you.

> You are nobody..keep trying though.

>Never said I was but you have proven my point.

What is your point Glenn? I thought It was that my refusal to admit something.

>You never cease to amaze. Tell me again your technical synopsis
>on adjusting components with a metal screwdriver

Ok

Coils are Inductors that cause a magmatic field when current is passed through them.

You can change the characteristics of a coil by introducing metals such as ferrite in the core. Any metal used to adjust the ferrite position within the coil will affect the coils magmatic lines of flux.

If you use a metal object then once moved away from the coil its characteristics will change causing your adjustments to change.

Plastic tools have been designed to do such adjustments.

Trimmer Capacitors are often used to change the frequency of a crystal oscillator circuit. When using a metal object such as the jewelers screwdriver "Cheek Suggested" when it comes in contact with the adjustments screw, current flow caused by a difference of potential from you body to the scanner. This current flow will travel into the circuit through one end of the capacitor by you makings physical contact or close contact. This will effect the circuit making any adjustments difficult.

In these crystal oscillator circuits we are dealing with trimmer capacitors that are measured in the Pica Ferried. Humidity between the dielectric will even change the capacitance by changing its insulating properties. Think about what physical electrical contact will do.

>when you are clueless
>to the component you are talking about. You didn't even have
>a clue but argued anyway.

Have another look I just repeated myself and then sum.

Show me your clue Glenn, or do you have any?

You Failed again to show any clue.

>Yea, we both get it Ron. You are
>dead wrong but like many children you can't take responsibility for
>your actions.

What actions Glenn my boy? Supporting my argument?

Instead of just attacking me saying I'm wrong and a child how about supporting your side.

Again you STILL FAIL to do so.

Your only purpose is to get involved in the Argument between Bill and Others. This time me. You have nothing to add. This is a common practice of yours and normally does not deserve a reply. Consider yourself privileged to have received a

ZZZZZZZzzzzzz........

History will speak for itself here Glenn. I have lots of history saved would you like an example? How about some comments you made on 8/29/96 Another argument between Bill Cheek and John Mackey. Here too you had to jump into someone elses fight and add your crap. Have look for yourself.

```
-------------------
John Mackey/KA0SSF <nothing@anywhere.edu> wrote in article
<322640BF.4D3E@anywhere.edu>...
> That's OK Bill. You have been given a chance to defend yourself just
>like
> you would in a court. You chose not to give your side of the story, just
>like
> you could in a court. We will all judge on the evidence provided.
```

Playing court now are we? I always thought it was up to prosecution to present enough evidence to prove beyond a reasonable doubt. You haven't presented a thing other than second hand rumors. Sounds like you lose.

```
Seeing you want to seek out truth and justice why so quiet on the lie
I called you on? You know, where you said I caused problems and had my
access restricted to rec.radio.swap. I even bet you thousands of
dollars to put your money where you
big mouth is. I am waiting for your proof that I have ever been
restricted from any newsgroup. You can't because it is another of the
long string of Mackey lies.
----------------
```

Would you like any more examples? I have a lot archived from this newsgroup. And a few others. I may just supprize a few of your type.

You added nothing, but flame anyways. You continue to involve yourself with other peoples arguments. You have nothing useful to contribute.

Grow up and give your head a shake.

Unless you can in the future support your argument then all you will ever get from anyone if your lucky is ZZZZzzzzz.....

We all make mistakes Glenn, you made one here. Move on.

>grh

I'm not a scanner listener, I dispatch for a living but a couple of years ago I worked for a central dispatch north of Minneapolis and one of my colleagues got a bit tounge tied. She had a call of juveniles throwing snowballs over the interstate highway.

She called the single person squad for the sparsely populated city and he acknowleged her.

Dispatcher: "one-robert fourty one check on juveniles throwing snowmobiles over the I35, near the such and such overpass"

Long pause

Finally the squad responds "Errrrr you want me to go alone on that?"

The dispatcher looked around the center and couldn't see anyone, we were all rolling on the floor.

Actually, Radio Shack isn't being silly about the catalog issue, the customers are! And, if you don't like being asked your name and address OR paying 2.95 for a catalog, then shop somewhere else ! ! !

Way to go ! ! ! I worked at Radio Shack for almost 3 years and for the most time really enjoyed it. "Most" of the customers were very nice, but then again, you've got the people that just won't be happy unless they give you a hard time. My manager has been with the company for over 15 years and to this day, I can't see how he's lasted this long. Why do people continue to go back to Radio Shack if they have so many gripes and complaints against them!

Glade to see more POSITIVE Radio Shack input here !

One of the only reason we don't have a huge military, is that we don't
give anyonne a REASON to wan't to attack us. We also realize that we
don't need to spent Trillions of dollars every year making sure that
we can dictate what the rest of the world does.

4777. Re: Motorola 800Mhz Radio

Newsgroup: rec.radio.scanner
Date: 1996-09-14 00:00:00 UTC
From: Scooter179 <slowry@interaccess.com>
Message-ID: <323AFB7C.C03@interaccess.com>
Source record: 223209

The info I have is that the ID is made up in the following format

(eg. Radio ID # 1234567890) would code out to;
System ID = 1234
Fleet ID = 567
Unit ID = 890

The ID is actually in hex format but you get the idea. This is
the minimum info necessary for the controller to recognise a legit ID.
You also would need to know the control channel frequencies (usually 4),
these are the only freqs you need to program. The controller tells the
radios the other freqs (that way you don't have to reprogram all the
radios in the system if you add freqs.). For instance, a radio would be
programmed with the following info;
System ID = 130E
Fleet ID = 008
Unit ID = 000F
Control Channels = 860.0375
859.0375
858.0375
857.0375
You also need to program in what subfleets you want (with a Type
1 system, a Type 2 uses Talk Groups), usually 0-5. Subfleet 0 is the
fleetwide call, 1-5 are individual subfleets. In a Type 2 system it gets
complicated because there like 4000 available groups identified by a 3
digit hex code (000-FFF).
Other info included in the programming is the connect tone
(usually 105.88 hz), failsoft freq, fleet size code,and a couple of other
things. Good luck trying to decipher the info. Motorola did a good job of
making it as difficult as possible. BTW, for about $4000 you can buy a
piece of test equipment that will read all the system data over the air
(for those of you who just hit the Lotto).

> provincial police. And we have a MUCH lower crime rate (befitting of
> the best country in the world to live).

Yeah, yeah, yeah. Low crime rates are nice. One major police force yada yada yada. Our local cops aren't Royal or Mounted (well, we do have a lot of female cops, but many of them are lesbians so they don't get mounted often). Multi colORed money..coloured...whatever. Go ahead, use too many letters to spell the same freakin' word. Our money is instantly recognized around the world. Print your all your signs in two languages. But when the shit hits the fan and there are dastardly deeds done around the world, the rallying cry isn't, "This is a job for the Canadians!" I don't even know the name of your current leader, and I keep up with current events. Our leader is a fat womanizing redneck and everyone knows his name. Don't get me wrong, I think Canada is probably a pretty damned nice place to live, and I am currently drinking Canadian Club. But nobody screws with Canada because they're don't want to piss off your neighbors to the South. Just about everything worth having was invented where? In the good ol US of A! You live in our protective shadow and all you can do by way of thanks is show your contempt for our way of life. But you make some damned good bacon, hockey players and comedians so we're glad to have you as our neighbors.

We should start a new newsgroup to explore our differences and celebrate our similarities.

Malcolm

4779. Pro 2006 and OS456...

Maybe someone can help me out here... I can't operate my computer within 10 feet of my 2006 or pro 46 without a bunch of noise. If I had the OS456 and the software, I still couldn't get them to work and play well with one another. Does anyone else have this problem with the 2006?

Malcolm

I worked for R Shack for about 8 months. We did at our store. Computers, phones, you name it. Anything that wasn't completely broken upon return, we attempted to give a "new" home. (ha, ha.) We were *supposed* to be very careful about repackaging it....We had that clear packaging tape for making very neat reseals on boxes that were previously sealed with the same kind of tape. The managers' rationale was that if the customer couldn't tell the diff, then it WAS just like new. Sheesh.

Tandy cracked down; whether it was out of fear of 60 Minutes or the good of their corporate heart, I dunno...now @ Radio Shack used and display merchandise is sold at full price, but with double the warranty (or something like that.)

Something you apparently don't have: experience. You have really
displayed your ignorance to the world in your lame, sad attempt to
attack Cheeks.

>Knock Knock, anyone home? you do not use a metallic screwdriver
>ANYTIME for any oscillator adjustments. No point in repeating myself
>here because you just don't and can't understand.
>As for reading your article, I did just before I used it to line by
>bird cage.
>
Let's add this up: I posted a problem, some folks (not you) made some
very nice shots at diagnosing the problem; Bill Cheeks then posted a
very clever and useful method which many of us were grateful for.
Your sum total contribution to this technical discussion was a very
pathetic personal attack on Bill. He (and others) responded, letting
you know that the method does indeed work and that your technical
comments were not relevant to this situation; some folks have actually
tested the method and can attest to it's validity and your errors. So

you throw another childish comment out.

merc

I'm not sure what your personal problems are that compell you to display your immaturity for all of us to see. I am glad that people like you are in the minority on this group, and I'm thankful for people with a lot of technical experience, such as Cheeks and the others that helped me track this problem down and fix it without having to send it to Radio Shack (with a check for $125).

***** NEW LOCATION *****

The September meeting of the
Tarheel Scanner/Shortwave Listening Group (RARS SIG)
will be held on Monday, September 16, 1996 at
Big T's Restaurant on Western Blvd. in Raleigh, North Carolina

Big T's is a seafood and barbecue restaurant approximately 2
miles outside the I-440 Beltline on Western Blvd (whereas Mr. B's
was inside the Beltline).
Everyone is invited to have dinner with us at 6:30PM, and the
meeting will begin at 7:30PM.
*** NOTE: Big T's policy is that, for meetings such as ours,
there is a $2 service fee for ALL ATTENDEES... whether you eat
dinner or not. This $2 service fee is in lieu of any "tips", but
it is *not* optional.

The program this month will be on the Carolina Fire Page
System. No doubt we will also swap Hurricane Fran "war stories".
I'm sure it will be a very interesting program.
For more info, E-mail me at cphillips@pobox.com

Curt Phillips KD4YU, Chairman, Tarheel Scanner/SWL Group

Source record: 223234
Cross-posted to: alt.radio.scanner,,rec.radio.scanner

I just got my 8000 back from EDCO and they had to replace the whole IF board. The new board has different parts on it than the old board. Also the "800" dosen't seem to have as much audio clipping. The Murate Erie filter (F3) inthe old board is a CFWM455F with the letter "U" under the 455F and the new IF board has a CFWM455F BUT it has a "V" under the 455F. I think it has to do with the skirting of the filter(What ever skirting is). Anyway the "800" is much much better. There is also some other differencies that I noticed, such as in the new IF board there is a diode between "Y1" AND "L1" . Anybody have any ideas???

> 0 Hz - 30 Hz --- (Undefined)
> 30 Hz - 300 Hz ELF (Extremely Low Frequency)
> 300 Hz - 3 kHz VF (Voice Frequency)

Though this may be a trivial comment, I also find this in most electronic texts, but the frequency range of voice or human hearing is usually listed in with the various listings of the electromagnetic spectrum. The problem is that human voice and hearing are an acoustic phenomenon, not electromagnetic. A 1000 Hz electromagnetic signal can not be heard with the ear just as a 100 kHz acoustic signal can not be picked up on a VLF receiver. The two are completely different as far as what one uses to produce and detect signals within each medium.

In your opinion, maybe. Fine. You filter it out.

>some folks have actually
>tested the method and can attest to it's validity and your errors. So
>you throw another childish comment out.
>

Some have the opposite.

I also have experience in radio electronics and have worked in the field and have my own opinion which often differs from Cheeks so its not childish. The fights, maybe but not the technical stuff.
I supported my views with technical reasons, you fail to.
What is childish here?

>merc
>
>I'm not sure what your personal problems are that compell you to
>display your immaturity for all of us to see.

The key here is "I'm not sure" That's right, you are not sure, but
many others are sure and have first hand knowledge of most of the
arguments with Bill and don't feel its "immaturity" maybe more like
its a justifiable response.

> I am glad that people
>like you are in the minority on this group,

Sorry to hear that.

>and I'm thankful for
>people with a lot of technical experience, such as Cheeks and the

Does anyone else have one these receivers? I've had mine for the past 3+ years now and have really enjoyed it(except for bad intermod] it's convienent remote control is really handy especially when used with a pair of cordless headphones. It has uninterupted coverage form 25.0 ~ 999.995 MHZ[am, fm wide/narraow] and early advertisements boasted an optional computer interface. Unfortunately when I purchased mine this feature was not available. I am wondering what it would take to enable this feature if at all possible. Thanks!

Mr. Lamb

If this is a personal thing why are you doing it in public? It seems that
if you are going to perform your act in public, the public has a right to
comment. It has never stopped you before.

> >You have really
> >displayed your ignorance to the world in your lame, sad attempt to

This thread has been your on going refusal to admit you were wrong, Bill's
procedure was right.

>I do not stand alone on my feelings against him.

So what does that prove? If somebody, anybody agrees with you then
you assume you must be right?

> Some I support and some
> support me. If you choose to side with me or Bill its your choice,

You were talking to anybody that read the thread. It is a public forum. If
you are so concerned about who interprets who you are talking to then take
it to E-mail. If not quite whining when somebody replies to your public
posts.

> >Your sum total contribution to this technical discussion was a very

> though.

In this thread yes it was. You went offensive and turned a deaf ear to
reason, even when presented by somebody other than Cheek.

> > He (and others) responded, letting

Let's see. You had no idea about the construction of the device that was
being tuned yet
argued like you were an expert and no matter how many people did the
procedure you
and found you argument had no merit you chalk it up to just opinion. I
think you
filter too much out.
>

>
> Happy to hear you fixed your problem, but now you have another one.
> You got yourself involved in an argument that never concerned you.

It concerns anybody that reads the public thread.

> Don't worry though, I just ended it.

Yea, you have said that about 20 times. Take a little walk through DeJaNews
and see what you have been saying Ron. You seem to forget. Maybe we should
do a recap of all your profanity, attacks, and stupid sayings like we saw
you
try on Cheek. Yea sure, you ended it. I doubt anyone is holding their
breath.

here in Calif we have a Cable-Theft of Signal Law which allows
the aggrieved to "break down your doors" and cause any damage they
want in retrieving the illegal boxes which get cable for free and
they can do it legally....no search warrant, no official complaint
followed with a police escort....just in they come and it's on the
books as being able to do....you cannot sue them for violating
your privacy rights or property rights or nuttin'.

The WS-1000 is manufactufactured by Standard in Japan and sold domestically
by them as the AX400.

It is marketed by Diamond as the WS-1000 and would appear to the basis of
the new "expected some time" AR16 from AOR.

The SR-001 was advertised originally as having RS232. Early colour leaflets
from Japan showed the RS232 socket fitted to the back however it never got
beyond that point as far as I am aware.

I don't think the SR-001 did Shinwa any financial favours and they left the
market as quickly as they arrived.

> they use mainly for the military aero band,how they like it,what
> they would suggest to buy,etc.Just would like some ideas before
> I buy.

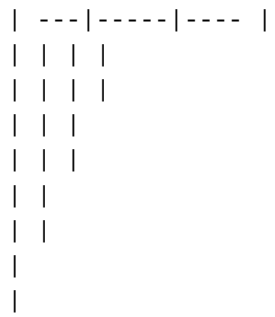
I appreciate that this isn't too helpful due to distances but just for the info:

The "best" type of base antenna I have come accross for the UHF Military airbands is one produced by a Comapny here in the UK called Revco. Going back some years they started to produce a wide band RX/TX antenna that they called a RADAC (Nest of Dipoles) This consisted on 6 vertical elements on a machine cylindrical head.

Rather than having wide band coverage we asked them if they could cut these 6 elements to cover the UHF airband from say 240-380MHz. No need to go to 400MHz as the Dipole "looks" up/down from its cut frequency. The end result was a very compact antenna with what turned out to be very good performance on the UHF airbands. The idea being that each dipole covers a certain amount of spectrum and where the "peak" performance of one finishes the next one of different length carries on as if it were a steady "flow".

Difficult to ASCII draw but:-

```
|
|
| |
| |
| | |
| | |
| | | |
| | | |
| ---|-----|---- |
| | | | | |
|===| O O |===|
| |
--------------
| |
--------------
| |
|===| O O |===|
| | | | | |
```



We have in the main found this to outperform other types on the military airband. Its possible to have 1 of the Dipoles cut for VHF Airband and the remaining 5 for UHF and the performance is still good. I guess if your interest was outside the airbands you could have dipoles cut to specific areas of interest that would hopefully give improved RX on those frequncies over say a Disconne but yet still maintain to some degree "average" RX over a wider spectrum.

Good luck.

Here are the first few channels from the PAL-B/G allocations.

Channel Image Sound

VHF-I (41-68 MHz) 2 48.25 53.75
3 55.25 60.75
4 62.25 67.75

Channel 1 is, to the best of my knowledge, not in use.

>buzz sound from European stations to know when 10 meters
>is opening up.

PAL-I, in use in the the UK(/Ireland?) may have a different allocation.

4815. WA State Patrol wants right to approve all radios

Newsgroup: rec.radio.scanner
Date: 1996-09-14 00:00:00 UTC
From: kc7iay@ibm.net
Message-ID: <Dxq8zp.C3L@eskimo.com>
Source record: 223257

The Washington State Patrol has proposed the adoption of a Washington Administrative Code regarding wireless communications systems used by motorists.

The proposed WAC: [new section]: "WAC 204-10-045 Wireless communications systems. Hands-free, wireless communication systems may be used by motorists while driving a motor vehicle. Listening devices that include an earpiece shall cover only one ear. Wireless communication systems must be approved by the Washington state patrol equipment review unit."

There will be a hearing held on October 9, 1996 at the General Administration Building at the State Patrol's Commercial Vehicle Division Conference Room, Ground Floor at 9am. Written comments should be sent to:

Carol I. Morton
Administrative Assistant Equipment and Standards Review Unit
Box 42635
Olympia, WA 98504-2636
360-412-8934

-=-

Comment by Bruce Miller:

There are three distinct parts to this proposed WAC: 1. Hands-free wireless communication systems is approved. 2. Listening devices attached a wireless communication system. 3. Approval of wireless communication systems.

There are several aspects of this proposed WAC that bother me.

There is no definition of "communication system" in WAC 204 or in the RCW (Revised Code of Washington) that I could find that pertains to this WAC. This means the WAC would apply to receivers and transceivers.

Note that there is no qualifying adjective before "wireless communication system" to restrict it to hands-free or two-way; it covers ALL wirelss communication systems.

Consequently, this proposed WAC can be interpreted to include receivers and transceivers, giving the Washington State Patrol the sole authority to determine what type or brand of radio equipment you could use in your vehicle--be it for am/fm, ham, CB, commercial, or cell phone, paging.

-=-

Here is some background info on the Commission on Equipment from the Washington Administrative Code and from the Revised Code of Washington.

WAC 204-08-010 Definition.

>> CITESEARCH <<

20408010

Whenever used in this title "commission," "commission on equipment," and "state commission on equipment" means the chief of the Washington state patrol.

[Statutory Authority: RCW 46.37.005. 87-16-032 (Order 87-01-ESR), 204-08-010, filed 7/27/87; 78-08-078 (Order 7760), 204-08-010, filed 7/27/78; Rule I, filed 3/21/60.]

RCW 46.37.005 State patrol--Additional powers and duties.

>> CITESEARCH <<

4637005

In addition to those powers and duties elsewhere granted, the chief of the Washington state patrol shall have the power and the duty to adopt, apply, and enforce such reasonable rules and regulations (1) relating to proper types of vehicles or combinations thereof for hauling passengers, commodities, freight, and supplies, (2) relating to vehicle equipment, and (3) relating to the enforcement of the provisions of this title with regard to vehicle equipment, as may be deemed necessary for the public welfare and safety in addition to but not inconsistent with the provisions of this title. The chief of the Washington state patrol is authorized to adopt by regulation, federal standards relating to motor vehicles and vehicle equipment, issued pursuant to the National Traffic and Motor Vehicle Safety Act of 1966, or any amendment to said act, notwithstanding any provision in >> Title 46 << RCW inconsistent with such standards. Federal standards adopted pursuant to this section shall be applicable only to vehicles manufactured in a model year following the adoption of such standards.

[1987 c 330 706; 1985 c 165 1; 1982 c 106 1; 1967 ex.s. c 145 56; 1967 c 32 49; 1961 c 12 46.37.005. Prior: 1943 c 133 1; 1937 c 189 6; Rem. Supp. 1943 6360-6; 1927 c 309 14, part; RRS 6362-14, part. Formerly RCW 46.36.010.]

NOTES: Construction--Application of rules--Severability--1987 c 330: See notes following RCW >> 28B.12.050 <<. Severability--1967 ex.s. c 145: See RCW >> 47.98.043 <<. Towing operators, appointment of: RCW >> 46.55.115 <<.

He had stolen the codes to make the radios operate--that was the illegial part. See the previous postings about "CPD Trunked system/hacker" for more details.

You are right, though. Just owning a radio isn't a crime. Perhaps there is a radio in development that will be able to decode the controls for the trunked systems and allow us to follow the talk groups easily.

has anyone ever seen or have this mobile scanner called "The Informant"?
it's a pre-programmed mobile scanner with wx also. i got one for 30 bucks
and it came with an antenna. it seems pretty ok, however, i am wondering
how old it is, how fast it scans and if the programmed freqs. are still
accurate. (ie. is it picking up all or most calls?) it's made by
Regency? anyone have a manual?

thanks in advance ->bh

4818. MODS FOR PRO 2011???

Newsgroup: rec.radio.scanner
Date: 1996-09-14 00:00:00 UTC
From: james.collins@awaiter.com
Message-ID: <842687160@awaiter.com>
Source record: 223260

I have a pro-2011 that I would like to modify, if possible.
Any and all mod's would be of help.
I've looked on the ftp: oak.oakland.edu and couldn't find anything there.
Any known mods?
--or--
Anywhere I can look for them?

I know that its a cheap piece @&?%&# ,but it was free and it does receive
excellent. I'd just like to tweak it a little.

Thanks a-lot to anyone who can help me out.
James.

For some reason Ron didn't want to keep this in E-mail so I will
reply here.

> From: Ron Katz <ronkatz@interlog.com>
<snip>
> You first started with others and lost. Now you want a go at me?

Really? Lost what. Do you mean the two lies I caught Mr. Mackey on?
I don't consider that winning or losing. It cleared up a falsehood
Mackey
was trying to present in his all too familiar fashion. You seem to be
using him as a role model and everything in your life is a win
lose situation.

Please clarify what I "started".

> I responded with ZZZZzzzzzzz..... Because your reply did not deserve
a
> response. It would be a waste of time. It added nothing and almost
put
> me to sleep.

> You do the same with others and have lost before like you will and
> have already with me.

Again, lost what. Is this the line of logic you use with your family
and
coworkers? What others? Be specific rather than using generic
generalizations.

> Glenn my Wonder Child, You still miss the point. If you want to get

Hmmm, what was that you said about childish?

> back to the technical side and drop the Cheek argument then we will.
> I'll still prove you wrong.

> You disputed my reasoning for NOT using metal tools when making
> precision alignment on a oscillator circuit. Remember? (probably
not)

Yes I did and I was correct as were the others that tried to reason
with you.

> You still fail to back up your views. Your only defense was On
> 9/14/96 you said...
>

> >"This thread has been your on going refusal to admit you were
> >wrong, Bill's procedure was right. "

Gosh Ron, did you miss in the same post 9/14/96 I said.....
-Let's see. You had no idea about the construction of the device that
was
-being tuned yet argued like you were an expert and no matter how many
people did the
-procedure and found your argument had no merit you chalk it up to just
opinion

Several other also told the newsgroup of their experience doing Cheek's
procedure. All said
it worked fine and they had no problems using a metal screwdriver. You
have seemed to
ignore this and stand firm that it work.

Also in the same post 9/14/96 I said.....
-You didn't have the proper information, made a false assumption
-but you are right anyway

Cheek replied earlier that the screw that you adjust is at ground
potential. You could
touch the screw with a 30 foot piece of wire and the radio won't see
any differently than
if you were touching some other ground point. It doesn't make any
difference. OK, depending
what you are using for an antenna it might act like a ground radial and
tend to
improve reception on a specific frequency range. Then again, this would
work connecting
it to any ground point on the radio but touching the adjustment screw
will
have no effect on the radio if it doesn't move it.

> How can I argue with someone who can not support their side but
> instead uses others to press on anyways.

Huh?

>
> Yes this thread has been going on.
>
> I do not refuse to admit WHEN I'm wrong. Just YOU have failed to show
> me that I am wrong.

Wrong. Read the other quotes from 9/14/96 I included above.

>You only say that Bill's procedure was right.

Wrong. Read the other quotes from 9/14/96 I included above. That
is not what I did but you seem to have a selective reading loss
problem.

> Children fight this way. Are you a child?

What is your childish obsession with name calling? Maybe children do
if that is what you are. They try and twist things to make them right
or
they leave out certain things to try to make things right.

> Yes the procedure was right, but the choice of tools is wrong. I said
> why. What do you not understand Glenn? Maybe I can help you.

It has been explained that any tool can be used in this procedure. Yes
Ron,
TV repair 101 states you should use non metallic tools when adjusting
tuned
and similar circuits. It is also a gimme to most anybody that played
with old
National, Heath, Hallicrafter and the like tube radios that if you
didn't have that
plastic wonder when tuning IF cans that you then tweaked them with that
metal
screwdriver. You tune for the highest signal strength and noted the
meter reading.
You then went a little one way or the other until it showed the proper
reading
when you removed the screwdriver. This also works on trimmer caps.Tuned
coil
and capacitance circuits have been around allot longer than the
availability of
non metallic tuning tools to radio hobbyists.

> > You are nobody..keep trying though.

What was that you said about childish??

> >Never said I was but you have proven my point.
>

What you failed to see is that the adjustment screw is at ground
potential
thus the type of screwdriver has no affect. Would you like me to send
you
a copy of that part of the 2004 circuit from my manual so you can study
it?
Your theory is great but what one finds in real life is that the basic
theory they
learned has many paths to explorer. You will quite often find
exceptions to
some of the basic more simplistic rules in this case, tuning tools.

> >when you are clueless
> >to the component you are talking about. You didn't even have
> >a clue but argued anyway.
>
> Have another look I just repeated myself and then sum.

Sum??

I also have stated my findings which are supported by others that also
did the procedure on their Pro-200x scanners. Yes Ron, this afternoon
I took my 2004 and did the procedure. Plastic, steel, iron and silver
screwdrivers all work the same. Identical. Doesn't matter which you

use they all cause no change in the circuit when you touch or
remove it from the adjustment screw. The adjustment screw seems
to be at ground potential and is affected by nothing other than being
turned.
This is no different than what Cheek and others posted.

> Show me your clue Glenn, or do you have any?

Read the above.

>
> You Failed again to show any clue.

You seem to have failed to read or comprehend what has been posted by
a number of users on this subject.

>
> >Yea, we both get it Ron. You are
> >dead wrong but like many children you can't take responsibility for
> >your actions.
>
> What actions Glenn my boy? Supporting my argument?

The offensive way you do it and then the belligerent stance you
take when somebody disagrees with you.

> Instead of just attacking me saying I'm wrong and a child how about
> supporting your side.

I have, I did and three others also have through relating hands on
experience.
You still stand there saying I am wrong.

> Again you STILL FAIL to do so.
>
>
> Your only purpose is to get involved in the Argument between Bill and
> Others.

As I said before, it is a public forum. If it is just YOU and BILL then
YOU should take it to a more private medium.

> This time me. You have nothing to add. This is a common
> practice of yours and normally does not deserve a reply.

A bit generic again Ron. After a cruise through DeJanews with a
search on Ron Katz I would be careful in your glass house.

> Consider
> yourself privileged to have received a
>
> ZZZZZZZzzzzzzz........

I considered it rude, childish and even a bit out of character for you.

>
> History will speak for itself here Glenn. I have lots of history
> saved would you like an example? How about some comments you made
on
> 8/29/96 Another argument between Bill Cheek and John Mackey. Here
too
> you had to jump into someone elses fight and add your crap. Have
look
> for yourself.
>
-------clip----------
>

Funny. You jumped into a conversation between Cheek and a person asking for help. That person has even posted you were out of line. You didn't just offer an opinion on the tool to use you attacked Cheek and then others. Man, talk about the pot calling the kettle black. You have publicly admitted to being on the offensive, what more can I say that you haven't shown time and time again?

Public forum Ron. If a discussion isn't open to out side opinions than the participants should take to a private forum.

> Would you like any more examples? I have a lot archived from this
> newsgroup. And a few others. I may just supprize a few of your type.

Glass house Ron. Big glass house you have there. Some real nice profane posts you made not too long ago. What's the point? I really don't care. You can hide behind history or face the present. It's your life.

> You added nothing, but flame anyways. You continue to involve
yourself
> with other peoples arguments. You have nothing useful to contribute.

So why do you read anything I post? Why do you reply? Why do you care?

> Grow up and give your head a shake.

Very mature for one that is so concerned about childish acts.

> Unless you can in the future support your argument then all you will
> ever get from anyone if your lucky is ZZZZzzzzz.....

Gotten lots more than that Ron.

Give it a rest Ron. You blew it. The bottom line and there is nothing else to
dispute. Doing Cheek's procedure with a metallic screwdriver will work just fine. No problem. Period. The end. Good theory Ron, wrong example to
use it on.

Glenn

>Don in Indianapolis, IN

Don-

The 2037 is really not much like either the 2036 or 2045. For
starters, if my info is correct, the 2037 is a GRE built Triple
conversion radio. The 2036 is double conversion and built by Uniden,
and the 2045 is Uniden built, but I'm not sure of the IF stages.

The 2037 is either a love it or hate it situation from my dealings
with it. I had one for about 2 months and got such severe intermod
that I finally took it back and the manager agreed to let me trade it
in on something else. A friend of mine bought one and says I'm crazy
(that may have nothing to do with the 2037 BTW) that he's never had
any intermod problems with it at all.

If your friend likes it, great... stick with it as it seems to be a
nice radio for the money. On the other hand, if he's having problems
with it, there are others to look at including the 2 we were
discussing.

: >earthquake swarms there. These devices connect to a radio
: >transmitter that transmits a steady tone at, or around 2 kHz.
: >in the VHF radio frequency range.

The actual tones are not "around 2 khz". They're on 8 specific carriers of:
680 hz, 1020 hz, 1360 hz, 1700 hz, 2040 hz, 2380 hz, 2720 hz, and 3060 hz.

: >They are usually powered by batteries and solar cells.

Yup. Most are solar charged batteries that power VERY low power
transmitters. 250 milliwatt output into a yagi antenna is typical.

: > When the earth moves, the
: >frequency changes, and you can hear a "warbling" sound.

True. The analog sensors have a moving magnetic mass that generates a
voltage as it moves relative to the motion of the ground. A
voltage-to-frequency convertor modulates the carrier tone.

: >Heres what you need to monitor these devices. 1./ a
: >programmable radio scanner. 2./ a Radio Shack DMM

Very resourceful! It works but...
A better way (although probably more expensive) is to go grab a couple

freeware software packages from the Public Seismic web site at PSN.QUAKE.NET

Go look for a program called WINQUAKE and install it. You'll need to run Windows 3.1 or higher. Then you can grab and view the seismograms that have been collected form other amateur seismologist. Many run their own sensors. Others collect the same telemetry that the USGS or the universities use. WINQUAKE will allow you to view the seismograms from one earthquake from different sensors. You can plot magnitude and distance by moving the pointers for the P wave and the S waves. Waaaay Cool!

Another program is SDR for Seismic Data Recorder. It allows you to plug a PC-LAB 711s A-to-D card into your PC and see the lines from the seismometers just like the "big kids" do with thier mainframes. If you can't run WINDOWS but run DOS then you could set up a seismic station with an IBM XT/AT or compatible with another program called EMON (Earth Monitor). All of these are free to the users. SDR is a bit more spiffy but EMON supports more A/D cards. The info is one the web site. Check it out. There are also MANY seismogram data files that you can see. New ones are automatically uploaded withing a few minutes of an earthquake.

: >of known frequencies. BTW, did I say that the signals are
: >most likely horizontally polorized?

Well, here's a reprint of a Monitoring Times article about seismic telemetry that was written following the 1989 Loma Prieta earthquake. Since I wrote it I don't have too much to worry about concerning copyright infringment... :) Ken

PS
IF you're within range of a seismic transmitter or an RF repeater then you might be a candiate for one of the PSN telemetry demodulators. Each demod unit is user programmable for any of the 8 carrier tones (unlike the USGS demodulators...) :) They run on 110vac but could be powered from 2 12vdc lantern batteries if you wanna use it in the field. You need audio output from a receiver to drive the demodulator. As the tone changes freq the demodulator produces an analog voltage that swings btwn +12 & -12 vdc. You use this DC voltage to drive your analog-to-digital card in your PC.

Larry Cochrane, the PSN webmaster and seismoholic extraordinaire, is about to make another run of demod boards. Drop him a note if you're interested. His e-mail address is cochrane@PSN.QUAKE.NET

---------- Reprint ----------

EARTHQUAKES - AFTER THE SHAKING STOPS

In the United States, whenever people think of earthquakes, they naturally think of California. While we certainly have our share of earth shaking events out here, they are in no way limited to the west coast, as evidenced by recent moderately strong temblors that shook areas of the Dakotas, Wyoming, and even the northeast. Earthquakes can occur almost anywhere. The are among the most costly of all natural disasters - in terms of both

dollars and in human lives.

Whenever the ground shakes, so do people's nerves. Phones ring, emergency services are activated, and the radio comes alive with traffic. Communication lines become jammed as people report damage, call for help, or try to contact their family and friends. The effects are stimulating to some, devastating to others.

Most people dread earthquakes. For the scientist of the Office of Earthquakes, Volcanoes, and Engineering Division of the United States Geological Survey (USGS), an earthquake is a subject for study. It's an opportunity to examine data, search for correlations, and test theories, ultimately with the hope of learning how to predict when and where an earthquake will occur.

At the Western Region Headquarters for the USGS in Menlo Park, California, data is collected from more than 500 different recording locations. The state is criss-crossed with the largest seismic network (CALNET) in the United States. It is made up of sensors, telemetry links, and analog and digital recording devices. Not all of the components of the network belong to the USGS. The CALNET system is made up of sites maintained by USGS, Lawrence Livermore National Labs., University of Nevada at Reno, University of California at Berkeley, and the California Dept. of Water Resources.

Data is collected from several different types of sensors that measure different motions or, that are especially responsive to specific frequencies of waves. Much of the data arrives at the Menlo Park center by VHF, UHF and microwave radio links. Data processing systems monitor the network and can produce real-time locations of earthquakes with magnitudes (M) between M 1.5 and M 3.5, within minutes. Whenever seismic waves are detected by instruments at 4 different recording locations, an "event" is declared and the data is routed to additional computers for further analysis.

When a seismic event occurs some devices, called vertical gain accelerometers, use a spring loaded mass mounted in a sensor about the size of a small tomato juice can. The mass is free to move relative to the earth. A magnetic field is maintained around the mass. As the mass moves, changes in the magnetic field generate a signal. The signal, typically around 1 Hz., is amplified up to 90 Db and converted to frequencies in the voice range. It can then be transmitted by conventional means (radio or telephone) to a central processing center for analysis.

Seismic data transmissions can be identified by the listener by their continuous tone. Ground movement modulates the signal which changes the tone. As the spring loaded mass moves in one direction the tone increases pitch, movement in the other direction decreases the pitch of the tone. The analog data produced can be displayed on the rotating drum seismographs that we see on the 11 o'clock news after an earthquake. During an "event", this analog data is digitized at a rate of 100 samples per second and saved in the data processing center for analysis.

VHF and UHF frequencies used to transmit the data are usually found in the US Government frequency allocations. Occasionally you may find telemetry on frequencies licensed to universities. Transmitter output power is typically less than 1 watt. Many sites provide reliable data with only 100 milliwatts of output power. The signal is transmitted by horizontally polarized beam antennas and may be relayed several times before it reaches a processing site. Emissions are narrow band FM.

Routine monitoring of the voice channels of the USGS does not produce a "hot bed" of excitement. Voice traffic is normally between technicians testing equipment or making transmitter adjustments. Some traffic concerns the daily checks which are performed on all data channels to insure signal integrity. However, following a significant earthquake, traffic can be heard concerning epicenter location, evidence of surface ruptures, placement of sensors, microwave path alignment, and communication between scientist and engineers in the field.

Aftershock Early Warning System
William Bakun is a seismologist for the Office of Earthquakes, Volcanoes, and Engineering in Menlo Park. He was watching a television newscast that showed rescuers as they crawled through the rubble of the collapsed Interstate 80, in Oakland, California. The structure collapsed and trapped many motorist under tons of concrete and steel as a result of shaking caused by the October 17th., 1989, Loma Prieta earthquake. Aftershocks of the 6.9 quake were frequent.

They were of great concern to the rescuers. Additional shaking of the damaged structure threatened additional collapse and a potential for loss of life. As a branch chief, he discussed the problem with other members of his staff and came up with an idea - deploy an Early Warning System for aftershocks.

The prototype system consisted of four elements: 1) ground motion detectors and telemetry transmitters placed around the epicenter of the earthquake, 2) a radio receiver and central processing unit in Menlo Park, 3) a mountain top radio repeater, and 4) alerting monitors. The key to the system is the difference in speed that radio waves travel as compared to seismicwaves.

There are several different types of ground waves that are generated when portions of the earth's crust break during earthquakes. The speed of the waves depends upon the density and rigidity of the surrounding rocks. P waves are compressional or push-pull type waves. They are the first to arrive locally. In the San Francisco Bay Area, earthquakes that occur between 5 and 15 kilometers below the surface, typically produce P waves that travel about 6.2 miles per second.

S waves are the second to arrive. They usually cause most of the damage due to the severe shaking that is produced by the high amplitude waveform. S waves generated by the Loma Prieta earthquake traveled about 2.5 miles per second. Compared to the 186,000 miles per second of radio waves, the ground waves generated by earthquakes are real slow movers!

How It Works
The central processor evaluates the data supplied from the epicentral ground motion sensors and determines the magnitude of the aftershock. The system is designed to transmit an alert on all aftershocks with a magnitude greater than 3.7 on the Richter Scale. The alert consists of two, dual tone, multi-frequency signals that activate alarms at the remote receiving locations.

In the San Francisco Bay Area, the signal was transmitted by microwave to a repeater on top of Monument Peak, which overlooks the entire San Francisco Bay, Oakland, and San Jose areas. The alert was repeated on the VHF frequency of 169.825 Mhz. Every 60 seconds, a test transmission was automatically sent to verify that the links were alive and well. If an aftershock was detected that exceeded the 3.7 threshold, a different set of tones activated the alarms and warned the workers.

In the first 6 months of operation following the 1989 quake, 12 aftershocks were detected with magnitudes greater than 3.7. The system triggered alarms successfully each time. It did not trigger any alerts on aftershocks with a magnitude of 3.6 or less. One false alarm was sent due to a minor design flaw which has now been corrected.

The farther away from the epicenter that you are, the more time you have between the time of the alert and the arrival of the first ground waves. The Loma Prieta earthquake epicenter was about 62 miles (100 Km) from the severely damage areas in San Francisco and Oakland. The Early Warning System for Aftershocks developed by the scientists at USGS in Menlo Park, provided between 20 - 27 seconds of warning for workers demolishing the damaged structures. 20 seconds may not seem like a lot unless you're the one under tons of concrete. Any warning that allows you to seek refuge is a blessing. I know. I was there.

The system works. It is not earthquake prediction. It is a method of rapid notification of approaching seismic waves. When a seismic event occurs, the signals are analyzed immediately by the micro processor. If certain criteria are met, the alarm triggers. This all happens almost instantaneously - without human intervention. The current status of the system is that it is neatly packaged in the basement of the USGS in Menlo Park waiting to be sent wherever it is needed. Refinements have made it smaller and more compact than it was in 1989. It can be flown to a site and be quickly deployed to transmit the alert on any of the preexisting, nationwide, USGS frequencies. Remote receivers are provided by the USGS that respond to the alert tones.

Developments like these from the scientists and engineers of the USGS, can help save lives following other major earthquakes which will certainly occur. Current technology cannot predict when or where earthquakes will happen. Perhaps someday predictions can be made, but that day is somewhere in our future. This system is available now. It can be used to notify emergency workers to evacuate hazardous locations and seek shelter. Receivers, placed at radio broadcast stations, can provide a tone alert and warn the general public instantly, without disrupting commercial broadcast. Use of such a system for public notification will require a massive public education campaign to be effective and not create panic. Science and technology has provided us with a tool. It is up to the policy makers in our legislatures and emergency services to include systems like this in their disaster preplans. Japan, long known for its strong earthquakes, uses a similar system to detect aftershocks and automatically slow their high speed
Bullet trains before the approach of strong ground waves.

H.A.R.P.S.
Highway Advisory Radio Portable System
When traveling into or out of a disaster damaged area look for signs advising of temporary Travelers Information Stations. Photo 6 shows a H.A.R.P.S. station licensed to CALTRANS (California Dept. of Transportation). It was rapidly set up in a rest area 150 miles north of Los Angeles on Interstate 5. It broadcast on 530 Khz. and informed motorist of delays and offered alternate routes into the earthquake damaged areas following the Northridge Earthquake of Jan. 17, 1994.

According to the manufacturer, Information Station Specialist in Zeeland, Mi., 13 HARPS units have been built for the State of California at a cost of a bit over $30,000 each. Each unit can be remotely controlled by a cellular telephone link. While unattended, the messages can be checked or changed as needed. Different messages can be programmed to start and stop as required. Power can be provided either by 110 volt shore power or by a 2.5 kw generator which can also be started or stopped by the cell phone interface. Each trailer mounted unit has two transmitters, one on 530 Khz. and the other above 1600 Khz. Transmit output power is limited to less than 10 watts. The typical range is about 5 miles.

Public Seismic Network BBS
The Public Seismic Network is a computer billboard dedicated to sharing information regarding seismology and earthquakes. Weekly earthquake reports from the USGS and California Institute of Technology are made available for downloading to your computer. Other information is provided by members of the network that allow you to plot distance from seismograph locations to epicenters of earthquakes. The network has three nodes that you may access 24 hours a day.

Nonsense. That does not happen in X-301. The adjustment head of the
trimmer capacitor is at ground potential.

> In these crystal oscillator circuits we are dealing with trimmer
>capacitors that are measured in the Pica Ferried. Humidity between the
>dielectric will even change the capacitance by changing its insulating
>properties. Think about what physical electrical contact will do.

You mean picofarads? Anyway, the dielectric is beryllium ceramic.
Ceramic, in general, is not affected by humidity. Especially
beryllium ceramic. Physical contact with the grounded adjustment head
of X-301 does nothing until you turn the screw.

Comprende?

Well here are a few more for you. I didn't know about WOR's frequency and I
believe the WFAN frequency is wrong. WFAS-FM uses the frequency 450.650:

452.9750 Shadow Traffic F-1, Operations (PL 103.5hz), input 457.9750
450.8375 Shadow Traffic F-2, Westchester (PL 103.5hz), input 455.8375
453.0000 Shadow Traffic F-3, New Jersey (PL 103.5hz), input 458.0000
(Anybody know the F-4 frequency and what is it for?)
455.5625 Shadow Traffic F-5, Production (PL 103.5hz), simplex
Also WINS-AM
450.1375 Shadow Traffic F-6, Connecticut (PL 103.5hz), input 455.1375
450.8125 Metro Traffic, Production (PL 67.0hz), input 455.8125
450.0875 WCBS-AM, Production (PL 94.8hz), input 455.7000
This is also known as Shadow Traffic F-8 and is used by AIR-9
(a Shadow Traffic reporter) for Suburban Sky Patrol reports.

450.5626 WALK-FM, Production, simplex

4836. VHF-UHF Radio Path Analysis

Newsgroup: rec.radio.scanner
Date: 1996-09-15 00:00:00 UTC
From: bcheek@cts.com
Message-ID: <323bb5e1.281603879@192.188.72.23>
Source record: 223033
Cross-posted to: rec.radio.scanner,alt.radio.scanner

It is all too often incorrectly stated that VHF-UHF radio waves are "line of sight" only. This leads scannists to think they can't reach out to hear all there is to hear over a fairly wide radius.

First of all, this "line of sight" is only a conservative rule of thumb in the sense that if a transmitter is within optical line of sight, then it's almost certain that a scanner can detect its signal; at least out to a hundred miles or so, depending.

There is a very good way to estimate the "spreading loss" of an RF wave over distance where pure line of sight is available.

Line of sight is defined as a straight, unobstructed line from the receiver antenna to the transmitter antenna where at no point in between is the earth or other major obstacle within one wavelength of that line.

Free Space
Path Loss (dB) = 36.6 + 20*LOG(F) + 20*LOG(D)

where F = Frequency, MHz
D = Distance between antennas, miles

Example: Mountain-top NOAA weather station on 162.400 MHz at 110-miles distance"

Loss (dB) = 36.6 + 20 Log 162.4 + 20 Log 110
= 36.6 + 20 (2.21) + 20 (2.04)
= 36.6 + 44.21 + 40.83
= 121.6 dB

Now that's the path loss. But we're not done. Now we add PATH GAINS to the loss to get a net loss or *received power* relative to 1-watt. There are four main variables here and two minor variables:

Transmitter power (dB relative to 1-watt)
Transmitter antenna gain, dBi
Receiver antenna gain, dBi
Path Diffraction Loss (dB)
Transmitter site (coax) loss (dB)
Receiver site (coax) loss (dB)

Let's make reasonable estimates of these for a combined path gain. As we assign estimated values, we'll use (+) for gain and (-) for losses and then combine them for a total:

Tx power (dB rel to 1-watt) (100-watts): +20 dBW
Tx antenna gain, dBi: (phased array) + 4 dB
Rx antenna gain, dBi: (discone) 0 dB
Path Diffraction Loss (dB) n/a for now
Tx site (coax) loss (dB) - 1 dB
Rx site (coax) loss (dB) - 3 dB
==========
Net Path Gain: +20 dBW

Received Power (dBW) = - Path Loss (121.6 dBW) + Path Gain (20 dBW)
= -101.6 dBW, or
= 101.6 decibels below 1-watt, or
= 6.92 x 10E-11 watts, or
= 69.2 picowatts (pW)

Now that we know received power, we can calculate received signal strength, in microvolts:

Ohms Law: P = E * I
= E^2 / R
= I^2 * R

We know resistance (antenna & receiver input impedance = 50 ohms) and we know the received power, so:

.0000000000692 watts = E^2 / 50, or
E^2 = (.0000000000692)(50)
E^2 = .00000000346

Taking the square root of both sides, we then have:

E = .0000588 volts, or
E = 58.8 microvolts (uV)

Definitely a receivable signal, since receiver sensitivity in most scanners is at least 1-uV.

Now this estimate really needs to be modified by the diffraction loss of the radio wave over that great of a distance, but because diffraction of radio waves varies with weather, temperature, etc, I left it out for now. If you guys want to get into the mathematical modeling of radio paths, I'll be glad to continue with diffraction loss, and then other models to account for radio reception beyond the line of sight (oh yes, indeed!!) And even how to calculate the loss caused by an obstruction, such as a ridge, hill, building, etc.

This kind of stuff might be elementary to some of you wizards out there, and over the heads of others. I'll be glad to explain anything in detail, if questions arise.

We've only begun.....

Another, brain surgen..."It worked for me" Yeh so? Your missing the point, I'm not talking about it working or not, I'm talking about using the correct tools and why.

What the heck does "It worked for me" have to do with anything???????

What looks dumb here is you idiots who join in the argument with still nothing to add but some stupid comment that still proves nothing.

Its basic physics and electronics here McFly, Argue that, and my opinion not the fact that some procedure worked or didn't. That is not what we are talking about here.

Anyone else want to say that Bills procedure works?

Yes I know that...THE PROCEDURE BILL TALKED ABOUT WORKS

The choice of tools is wrong and I flamed why. Read the post.

Another Netcom wonder....ZZZZZzzzzzzzzz......

: : >Heres what you need to monitor these devices. 1./ a
[snip]
One other problem with Dr. Pepper's method that is solved thru the use of
a demodulator is that many of the telemetry signals are multiplexed.
Unless you use a demodulator to listen to *one* signal rather than
several you'll get a lot of garbage in your data. If you just want to
know when an earthquake occurs this isn't a problem but if you actually want
to look at the data for the seismic waves you need to eliminate all but one
signal per trace. The site I monitor has 6 different sensors on 1 RF carrier.
Some of the sensors are high gain some are low gain. Some detect vertical
motion. Others are horizontal.

> The other evening I noticed TV audio on 44.340MHz.

In the US, Ch 3 audio is 65.750 MHz (some stations are offset 10 kHz to avoid interference). 65.740 - 2*10.7 = 44.340 i.e. an image frequency.

: How did he get arrested? Just having a radio does not make a crime!

However, having a Motorola radio able to follow trunk groups usually means one has access to the proprietary system key or to specialized Motorola software capable of programming the radio without the system key. Either way, Motorola's lawyers would probably consider this theft. Even if a radio shop did the programming for him, Motorola would probably consider the trunking info in the radio proprietary.

Either way, if it's a bogus charge it will probably be a case of who can pay the lawyers necessary to win the case. My bets are on Motorola.

> sending the message before it gets to the ouija board.
> What frequency is this on?

Depends on the Ouija Board. Some use the 49 Mhz band some of the newer ones use the 900 Mhz band. The Demon has switched most of his work to 900 Mhz frequency hopping but he still uses the "in the open" 49 Mhz to communicate with cult groups, Catholics and politicians. The most active frequency in this band and the choice of most Ouija monitors is 49.666 Mhz. You might consider subscribing to the Spirit-L mailing list.
You can get info by sending mail to Spirit-L@majordemon.evil.

The fact of the matter is that the legislative and executive branches at all levels of Government know that for a law to be deemed unconstitutional it has to be challenged in court and found to be unconstitutional. Until such time, they continue to enforce such laws as written. They know full well that most private citizens do not have the financial resources to challenge them in court.

As far as the Clinton goes not only is he, by his actions, against a robust interpretation of the first amendment as applied to the internet, but he has called for greater lattitude in wiretapping the citizenry (just look at what they did with those FBI files) and is obviously anti-gun. How crystal clear did the founding fathers have to be in their stated belief in a citizen's right to bear arms (concealed or not) for today's idiot politicians to finally get the message.

>place.

Perhaps we have two different issues here - sounds like the remote
broadcasters were probably using the cell phones to recieve program
sound (and "cues" from the studio control) and they may have been
sending their live audio via VHF or UHF (for better audio quality)...

> TIA.

Hi Linda,

I've had a Pro-2035 for a year now and I and the bottom line is that I like it and I am very happy with it. There are a few negatives. The channel auto store for one (the scanner searches a frequency range and automatically stores active frequencies) will store the same frequency more than once. It has 100 channels per bank, that's a little overwhelming especially if you want to organize the banks by catagory. What makes this frustrating for instance is if you only program a given bank with amateur radio frequencies and you've used only 50 channels, you have manually lock out the remaining 50 otherwise it will scan through those. I think the new Pro-2042 has taken care of these problems. But I don't think these are big enough problems to pass up a good deal.

>
> It's a mini-Ricoh Law....you know, the one the FED's use to confiscate property so they can sell it and finance their respective costs involved in running this GESTAPO-like agency to protect the life and liberty of those they don't come after.

It's amazing how much people think the Constitution is the final say on what the government can and cannot do. No, it's the legislature who is in control who are in obeyance to the Justice Dept....something which the founding fathers set in motion by making each separate divisions of govt.

People assume too much when they refer to the Constitution for why not. That's high school history lessons, which are a romanticized version of the real world.

Look at how Clinton is going after "individual freedoms of thought and security" with these new laws based on the bombing of flight 800 and the laws he wants which allow undiscolosed and free-access to wiretaps and no cause to review anyone's records.

Look at how Clinton signed into Law the Internet Deceny Act which forbade discussion of ABORTION on the net. Look down the road when listening to scanners will be "subject to licensing" as in any totalitarian state....look how UNFREE Canadians are when it comes to Press Access....

Actually it's a moot point: digital radio will eliminate the
market for scanners.

>
> If this meaning is taken at face value, then why did the process of getting the Cheeks guy banned from this group... people demanding his ISP denude him and cast him out into the land of neither here nor here.

If your statement about "recognized as an anarchy" exists with the use groups, then why the collective sending to his ISP demands that he be silenced?

Where is the logic here? Or is it a place just for you and your thinking and when the Cheeks' Guy gets in your way of explaining it, he's a bad ass and must be silenced via the coward's way out: have his ISP do it based on deception and having many personal axes to grind because he likes to use the POOP word whereas others prefer the use of "SHIT"....

Strange how people who enlighten get told to turn their brightness off because it is hard to see. And then using him as a "source of much information" after the deed has been done with the ISP. Brave people here.

I guess the truth hurts doesn't it Bill??

You should talk, this sounds like the bullshit you wrote
to my fido sysop. The only difference is that what you
wrote was all either lies or half-truths & what the AOL
user wrote to your ISP (below) was all true.

Bill Cheek wrote:

I suppose a person could try to get away with it but I think it is
ill advised. No competant technican or engineer would actually
recommend that.

Bullshit.

He brought up VALID & REAL issues from a technical & engineering
stand point which Bill SHOULD have know & been aware of. Hell,
you can buy the CORRECT adjustment tool from any radio shack
store for about as much change as most of us carry in our
pockects.

The REAL issue is some of you Bill Cheek ass kissers who can't
stand the thought that your Knight in Shinning Armour Bill CHeek
could possibly be wrong. No matter what, you want Bill to be
your little hero.

I hate to say it but Bob is right on this one. If the receiver can hold
the signal accurately for a minute or two then that is good enough.

I doesn't take much to do it.

Hello,

I just recently became interested in scanners.

Anyway, I went down to Radio Shack and bought a CHEESEY little home-made AM-VHF Radio with the cardboard mainboard and little spring interface things. I was just wondering if anyone out there has been able to do anything cool with it. Are there any simple mods for it or is there anyone who has done something amazing with one?? If so, please lemmie know..

...sorry to all those who would rather not have read this email...

>I've looked on the ftp: oak.oakland.edu and couldn't find anything there.

Right. No one has written up anything for the PRTO-2011

>Any known mods?

Expressly for the PRO-2011? No. There are dozens of things that can
be done to it, but you'd have to adapt them from mods published for
other scanners.

>Anywhere I can look for them?

Sorry, no.

>I know that its a cheap piece @&?%&# ,but it was free and it does receive
>excellent. I'd just like to tweak it a little.

Then you'll have to know first exactly what you want to do, and then
get that mod that was published for some other scanner and adapt it to
yours, It is easier done than said in many cases, and impossible in
others. That's why you need to be specific.

I'm a dispatcher and a ham...and 10-codes are used for brevity and
uniformity. There are instances, though, where innocent sounding phrases
are used to signify something completely different. I worked at a PD that
was experiencing a rash of "smash and grabs" during the Christmas season.
We had info that the bad guys might be listening with scanners.
Additionally, we had reason to believe we knew where they were going to
hit next. (I love snitches!!!) At the beginning of the shift, a unit
would go on surveillance at a pre-set hiding place. When it was time for
him to be relieved we would tell another unit to "Call dispatch at your
convenience." It meant for him to relieve the first unit.
Another instance is when we had units that gave different locations "color
codes." A unit would say to another unit, "Did you see that red (or blue,
or yellow, or brown) car at the intersection?" which would mean "meet me
at the 7-11" or some other spot. All those transmissions sounded
completely normal to anyone but the officers and dispatchers.

They also do it to keep all the traffic off the main channels, if you're refering to why they have it on a tac channel.

Funny thing is that the County FD here in Thousand Oaks uses the local mall for training so often, complete with simulated dispatches, that when there was an actual fire there once, everyone thought it was another drill.

>Can anyone please post a list of RCMP or Police "Caution" codes...
>some are obvious such as "Victor" for Violent or Violence, but some I
>can't come up with... "Hotel" and "Sierra Tango"... for instance.

I don't know H but S is Suicidal. I think your dispatcher/constables are slipping an extra T in there for "tendencies" perhaps.
The ones used around here are V/Violent, E/Escapee, F/Firearms, M/Mental, S/Suicidal. Maybe the H has something to do with alcohol, but here that's reported as either 10-68 (for drivers) or "77LCA" (for non-drivers, the section of the Liquor Control Act).

The caution codes for suspended/disqualified are: D/Driving, A/Alcohol, F/Firearms.

Some of the other puzzling ones are relative to your area. Forever I was hearing units in my area say 'meet you at 23' or 'come down to 23'. Didn't sound like they meant on-scene which is 10-23. Through some digging I figured out they meant the PetroCanada truck stop in the center of the district, at the intersection of highways '22' 'and' '1'. Which is 23. :)

Pardon my rambling.. :)

By squelch tail, do you mean a crackling hash sound at the end of each transmission? If so, my BC 3000xlt has this phenomenum. I don't recall hearing it when the scanner was new, but noticed it a couple of weeks ago. Sometime it can be rather anoying. I thought it iwas something I caused when the scanner was accidentally dropped.

Is it possible to order a new case for the pro-43 from Radio Shack? (the actual plastic case)
If so, do you know the part number and cost?
My 43 is looking rough and the numbers are starting to show wear I should have used a soft case or something. Is there a softcase made just for the 43?

Thanks

Actually the more George argues here the cumber HE looks. George has
consistantly been a Bill Cheek, blind & willing, ass kisser. Obviously
to ANYONE with even basic engineering or technical training would KNOW
that you can not use a metalic screwdriver to tune an RF circuit as there
will be unwanted effects to at least some degree.

> Its basic physics and electronics here McFly, Argue that, and my

I have one...

It is 2:30 in the morning a call comes in "1J-114 I am 10-80 (chase in progress) on a brown rabbit" Disbatch replys "10-4 114 and you 10-20 please..." "114 oh wait he just went in to super 4 wheel drive and went strait up the side of the mountain I am going to be 10-24 10-8 A description on that rabbit is a Brown rabbit, White tail, Long ears.."

I found that kind of amusing. This cop is a friend of mine and she is a riot! Just went on a ride along last night with her.

A well presented article. You may also wish to address Fresnel Zone clearance. This is often times overlooked, but an important part of propogation nonetheless. The mathematics are quite simple for calculating first Fresnel clearances.

The issue of diffraction was best covered by Bullington and is probably best left at that, for this newsgroup.

On Sat, 14 Sep 1996 18:11:55 GMT, ronkatz@interlog.com (Ron Katz) said
something kinda like:

>My attacks against Cheek where in the past in defense, now on occasion
>its on the offence. Its is part to due with on going disagreements. I
>do not stand alone on my feelings against him. Some I support and some
>support me. If you choose to side with me or Bill its your choice,
>but unlike Bill I don't need to drag you now into this. Its Bill and
>someone. In this case its Bill an me. No need to make it you and me.
>
I don't give a whit about any personal grudges you have with Cheeks.
If they are "Between you and Cheeks" and personal, take 'em to email
and keep them there. You entered yourself into a discussion between
Bill and I regarding a problem I was having with my scanner. All of
the comments by everyone involved in the thread were on a mature,
helpful level discussing the problem and possible technical resolution
of such. YOU are the one who jumped into the middle of our
discussion, and the comments you made were extremely immature and
worse (re: the wheelchair comment, among others; my backseater in my
F-4 in Vietnam lost both legs in a crash we survived, and I find such
comments highly offensive - though in keeping with your other
comments). If you're going to jump in and make childish, insulting
comments to someone who is going out of his way to help me with a
difficult scanner problem, then I'm going to request that you get
lost.
>
>>Bill Cheeks then posted a
>>very clever and useful method which many of us were grateful for.
>
>My arguments are against Bill not you. Again I"m glad you were able to
>find an answer to your problem. I don't know why you feel I was
>talking to you in the first place.
>
Because you inserted yourself into what was, before you tried to
insert some kind of personal agenda, a useful and interesting
technical discussion between myself, Bill, and others. Had you raised
technical questions about the method in an adult manner, I'd have
welcomed your input. Since apparently you only were looking for an
excuse to further some childish agenda, your input was extremely
irritating.

In other words, if you want to conduct some "Nyah NYah" thread, fine
(although it really is awfully immature). But when you start
inserting yourself into legitimate technical threads, you become a

nuisance.
>

>I also have experience in radio electronics and have worked in the
>field and have my own opinion which often differs from Cheeks so its
>not childish. The fights, maybe but not the technical stuff.
>I supported my views with technical reasons, you fail to.
>What is childish here?
>
The way that you made your comments, as noted above. Technical
disagreements are interesting and educational, when carried out in a
professional manner.

>>and I'm thankful for
>>people with a lot of technical experience, such as Cheeks and the
>>others that helped me track this problem down
>> and fix it without
>>having to send it to Radio Shack (with a check for $125).
>
>Happy to hear you fixed your problem, but now you have another one.
>You got yourself involved in an argument that never concerned you.
>
See above comments. You inserted yourself into a disccusion that
Bill, others, and I were having. Somehow, without namecalling, until
you stuck your flames into it.

Har! That's an excellent description of how "the Cheeks guy" does it on FIDO, where he's managed to appoint himself dictator of a scanner echo.

'Round here, of course, he has no such power, so you can feel free to ignore him or flame him or praise him or whatever breaks your squelch. The one thing you DON'T have to do is kiss his ass.

> I too proposed that anyone with a gripe against the Cheeks Guy

What is so difficult to comprehend? You are whipping a dead horse. Any change induced in the circuit by using a metallic screwdriver is insignificant relative to the task being performed. I've used a metal screwdriver on trim caps too! It worked for me. The more you argue the dumber you look.

: They use them to obscure their transmissions on purpose
: otherwise they'd speak "in the clear."

Not necessarily true. They are used for brevity (ie. "10-97" as opposed to "I have arrived at the scene." Try saying that ten times fast... In many places I have listened to, they don't even say "ten," they just say "Unit X is 97.")

If you listen long enough, you can figure most of them out in context.

I was able to locate some info on the CP as a scanner question you asked. My source states that most all CP's can be put into the program mode.

Some require a jumper wire connection, other are keyboard operation. In the case of one Radio Shack CP, a jumper wire was used in the handset and a couple of keyboard entries were made.

This allowed him to program in the 3 digit cell phone channel number. The phone did not scan but my source did mention which of the older RS CP's he used, catalog #17-1002. I looked it up in my 1987 catalog! A service manual, if obtainable, will most likely tell you what you want to know.

The CP used to scan may have been an old Novatel. It may have been talked about in an old RCMA issue, try 1985 or 1986. I didn't realize the info was that old. I'll try to get something more updated, if that's possible. Anyone want to anonymously tell us if they use their CP as a scanner, one channel or other wise?

Regards,
LGS

Source record: 222829

Dear Everyone:

I have not, in the past, been an active poster to this newsgroup, but I do from time to time like to pop in and read the posts to expand my scanning horizons. I have a 2006, so naturally I like to read any post with 2006 in it... Until now. Now I see a silly little argument going back and forth between people who have never met in person and all I can think of is this: Why is it that on the internet we are so much more willing to go to extremes with people than in person?

If Bill Cheek had mentioned his adjustment technique at a cocktail party with all of us in attendance, the worst that would have happened is that maybe someone might have said, "Well, Bill, I think that..." and a logical, rational discussion would have ensued. People might have gone home thinking that other people were arrogant or incompetent, but no name calling would result had these conversations been person to person.

Instead, here on the net, it seems that people are quiker to ignite, quiker to offend, and quiker to take offense. While standing in line at the bank I'd never ask a girl in line next to me if she'd like to have sex with me, but in IRC people do it all the time. It might make for an interesting sociological thesis, I don't know...

But what I'm getting at is this... as an "outsider" I have read both sides of these posts and I don't see any single person who is in the right. I have learned nothing new about my 4006 after having read many, many posts with "4006" in the subject. I have seen people get outright rude with one another and then try to take the politically correct moral high ground. I've seen sexual preferences, handicaps, and personality flaws discussed in great detail, with a few technical rebuttals thrown in here and there. Has any of this gotten anybody anywhere? Has anything been acomplished?

What I propose is this: Each of the combatants write ONE position paper on the subject, have your say, then shut the hell up about it. Then, perhaps, this newsgroup can once again be informative, enlightening and less Melrose.

That's all I have to say. Now I'll get off my soapbox and turn on my scanner.

Because there is nowhere else in my immediate neighborhood where I can purchase electronic parts, coax, antenna connectors, etc.

This is why Radio Shack gets away with all their nonsense. If Wal-Mart sold RG8 coax, NPN transistors, and 2-meter mobile antennas, the Tandy folks would have disappeared long ago!

Hi Adam,

The ones for Australia are:

10 Channel models

Base Handset

30.075 39.775
30.100 39.800
30.125 39.825
30.150 39.850
30.175 39.875
30.200 39.900
30.225 39.925
30.250 39.950
30.275 39.975
30.300 40.000

5 Channel models

Base Handset

1.725 40.025
1.740 40.075
1.755 40.125
1.770 40.175
1.785 40.225

The ones for New Zealand are very simular and can be found
at the following URL:

http://www.govt.nz/ps/min/com/rsp/gazct1.html

If your car stereo has a casette player in it you can do what I did. Go down to Wall Mart and buy one of those cassettes that people use to play poratble CD players through the car stereo. Put the cassette in the car stereo and plug the other end into your scanner adjust the volume and your set. Most scanners ear plug output is mono so only one channel (left or right) will produce sound, other than that it works great.

>point, I'm not talking about it working or not, I'm talking about
>using the correct tools and why.

Sometimes the "correct" tools are the wrong tools. Let's see YOU
specify the "correct" tool....its part number, and where to obtain it.

>What the heck does "It worked for me" have to do with anything???????

Because it works, and it is maybe the ONLY way it will work. I tried
a LOT of different tools in X-301 before I specified the #3 jewelers
screwdriver.

>Yes I know that...THE PROCEDURE BILL TALKED ABOUT WORKS

>The choice of tools is wrong and I flamed why. Read the post.

The choice of tools, a #3 jewelers screwdriver in the Radio Shack kit,
is the correct choice. I specified it. I wrote the procedure.

If you are capable of rewriting the procedure and specifying a
different tool, then by all means do so.

As it is, the specification for my procedure is correct as stated and
you failed to offer any viable choices.

it can be done with a non-operational cell phone however you need to place it in test mode. the other problem is that you have to manually punch in the channels until you hit paydirt. the next problem is to be able to follow the call from cell to cell. one thing i'd like to know is whether they can trace the location of a de-commissioned cellphone engaged in such a nefarious activity

> > Personally, I'm waiting for the AOR Tornado....It's out in Japan, but under a
> > different name.

It would appear that the AR2900 will remain "vaporware" and will not be part of the AOR portfolio. The receiver may however appear under an alternative OEM name (Camnis, Trident, Albrecht or something else perhaps).

> So what is the AOR Tornado? And what are tthe specs.

The Tornado will be the AR16 that would appear to be manufactured for AOR by Standard. It is not yet available in Japan although the Standard AX400 is. If "rumours" turn into hard facts then the AR16 is a development of the AX400 but with several additonal "AOR specific" features and compatbility with the Scout.

The AX400 is also available outside Japan under the Diamond Antenna brand name Welz as the WS-1000. It is a very small unit powered from just 2 x AA batteries and has coverage from 500KHz - 1300MHz.

> right.
>
> Thank you...

That should be correct.
Units are "18", then the shift "1(Graveyard), 2(Day Shift), 3(Evening Shift)" and then the beat area. Stanton is 21 - 29.

So, "18222" would be a Sheriffs unit, Day Shift, Stanton beat.

Try also 460.200 Orange South.

Good luck.

4977. AR1000 AM problem

Newsgroup: rec.radio.scanner
Date: 1996-09-16 00:00:00 UTC
From: dcarroll@onramp.net
Message-ID: <323cdb07.269001273@news.onramp.net>
Source record: 223002

I have and AR1000 and am getting HORRIBLE AM band reception. It's too the point that I can't hardly pick up any aviation stuff. The radio just picks up a lot of static and hum. Stuff that should squelch out but won't. I know a lot of it is radiated noise because I can't put it anywhere near my computer monitor.

I've sent it to AOR twice for repair, but it hasn;t helped.

Any ideas?

Yes.

>If so, do you know the part number and cost?

Yes. But there are several numbers, depending on what you want.
No. I don't know the cost.

There are a number of parts to the "case", and you should know exactly
what you need before ordering. The PRO-43 service manual is the best
guide here, with its exploded diagram that shows everything. So first
order the Service Manual: (800) 442-2425

>My 43 is looking rough and the numbers are starting to show wear I
>should have used a soft case or something. Is there a softcase made just
>for the 43?

Not "just" for the 43, but there are a number of soft cases that fit
it fine. Radio Shack even used to carry one, I think. Get the
service manual before you worry about anything else.

Here you go, Eric:

Unfortunately, you need a picture to do this mod, as the parts are not
labeled. The mod is in Radio/Tech mod handbook, and involves removing
one chip diode and adding a 1N914 diode under the microprocessor shield.

The link for the mod handbook is:

http://catmac.grove.net/CGI.SPG?L=F&P=BOK+10A

Hope this helps!

Rumor has it that Hillary Clinton has her own Ouija board frequency.
However, numerous attempts by the FCC to get the Clintons to divulge the
exact frequency have been stonewalled!! I guess it's nothing new.

I'm not sure that there is such an animal, , , , It is my
understanding that tactical call signs are generally chosen and
assigned by the local organization, not necessarily on a National
basis. The type of organization may some times be deduced by what they
are saying and by the call sign itself. ie; here at China Lake, there
is a tac call, , , , "fibre man" which I deduced to be the team of
people who are stringing fibre glass cables for landlines. Ones like
"Cherry Coke" are more obtuse. :-}
In any case, , , try the artsci book on federal government
frequencies. It's the best of _my_ library.

Since a Frequency counter has no Audio Output why is it illegal to find out if the Reporter is giving you a line of BS or not? I know it is illegal to listen to cell calls via scanner. But just finding out the frequency shouldn't be (seems stupid to me if it is) as long as you DON'T LISTEN after getting the info.

>
>Bullshit.
>
>He brought up VALID & REAL issues from a technical & engineering
>stand point which Bill SHOULD have know & been aware of. Hell,

As I have stated previously, if he had raised the issues in an adult
manner, rather than "this ain't your wheel chair" and "CB 101" ,etc.,
I'd have welcomed the input. It was obvious he was much less
interested in addressing the technical issue than he was in taking
potshots. And he was wrong to boot.

>The REAL issue is some of you Bill Cheek ass kissers who can't
>stand the thought that your Knight in Shinning Armour Bill CHeek
>could possibly be wrong. No matter what, you want Bill to be
>your little hero.

You also obviously have some kind of personal problem here.

I don't give a SHIT about your personal problems and grudges here.
LISTEN CLOSELY, although you do not appear to have a listening mode:

You're calling me, who you don't know, an "ass-kisser" because I
defend someone's successful technical contribution to a problem I
posted here. A technical solution that saved me at least $125.

You insult me because I resent someone jumping into the middle of a
technical thread I'm involved with, said person throwing out childish,
immature insults rather than simply stating a difference of opinion
(which would have been welcomed).

And you assume that because I am grateful for someone taking the time
to help out and solve my problem that I have a personal agenda and
some unresolved hero worship?

Do you realize how paranoid that sounds, how absolutely petty to those of us here who are just looking to exchange scanner information?

Sheeesh.

4993. Ocean City, MD - Scanning

Newsgroup: rec.radio.scanner
Date: 1996-09-16 00:00:00 UTC
From: georgef@prolog.net
Message-ID: <51i6qu$4nu@news2.ptd.net>
Source record: 223122

Thanks to all those who answered my questions on Ocean City, MD Frequencies several weeks ago.

This weekend I was in Ocean City. Here's what I learned. Yes, they are now running on a 800MHz Trunked system. How ever its not that hard to scan. The only thing is there are too many users on the system. But if you are only interested in Police Dispatch, you can easily find the 800MHz channel and lock you scanner on that. In over 48 hours it didn't change. on 48 hours the data channel didn't change.

Also, Police/Fire communications are still be transmitted on their old VHF lo freqs and on the old 400MHz Police freqs. So if you don't have a fast scanner, you still will beable to listen to action on the old freqs.

I did notice that all the police cars have TRUNK only radios. The cars nolonger have 400MHz equipment (atleast the antennas were definently 800MHz only) But I think the handhelds still looked 400MHz. This might be why they're still transmitting on both.

One last thing. I had trouble finding active Marine Freqs or VHF/UHF Coast Guard Freqs. If things work out next weekend I'll be back in OC for more scanning action. If anyone has Marine Infor for any of the Marinas or the USCG please leave me know.

Thanks,
George

Well I just purchased an AR-2700 last week and really enjoy it... For
the price $209 ya get 100-1.3 range, computer control, 500 channels..
Not bad..

Also the Cell blocking can be restored via computer interface &
software..

The irony is that I bought mine from EEB in Virgina last week and it
came unblocked (Full 800Mhz) right out of the box....

As of 9/12 they had around 35 units left..

4999. Attenuator Use on Scanners

Newsgroup: rec.radio.scanner
Date: 1996-09-16 00:00:00 UTC
From: dber@tiac.com
Message-ID: <323c1cb7.201184@news.tiac.net>
Source record: 223128

I got to thinking about the attenuator feature on my scanner. The manual states that you use this to stop strong signals from overloading the front end of your receiver. I typically use it so that a weak signal from a nearby town doesn't trip my squelch while a strong signal of the same frequency in my town will (I don't have CTCSS on my unit). I typically keep the signal set on 0db (no Attenuation) and I seem to pick up both weak signals strong signals fine. I don't know if strong local signals are "overloading" my front end. Would I be able to tell? Can I damage the scanner if I don't set the ATT on each channel I feel is "local" or strong? I assume that unless I was really close to a powerful transmitter, there would be no problem with leaving the ATT set to 0db. I know some scanners don't have this feature and some only have an ON/OFF toggle (or switch) which does 10 or 15db of Attenuation for all channels. For these types of units, I assume most people leave it set to 0db and never think about it.

Thanks in advance and take care,

Dave Bernazzani

5000. USAR (FEMA) Frequencies

Does the LAFD & LACoFD used the Urban Search and Recue frequencies?
If they do, what are the frequencies that are used on a regular basis?

The reason I am asking is......2 days ago I was scanning the County
Fire Department and heard a dispatch for USAR 1 along with the other
"ordinary" stuff. This dispatch was for an auto accident on the
Angeles Crest Highway. Also heard one dispatched to the Antelope
Valley along highway 14.

Any help to clarify these dispatches would be appreciated.

Source record: 223132

I bought one from EEB in August. The following are comparisions to my
trusty PRO-43:

Sensitivity: Pro-43 better by 20%
Selectivity: AR2700 better marginally
Birdies: AR2700 better (less birdies)
Operations: Pro-43 better by 100% (Easier by far!)
Features: AR2700 better by 50% (More features and bells/whistles)
Frequency Range: AR2700 has complete coverage, .5 to 1300, Pro-43 has
nothing below 30, and misses broadcast and other portions above 30.
Cellular restored on both radios).
Other Items: AR2700 more variable step sizes (5, 6.25, 9, 10, 12.5, 20,
30, 50, and 100 KHz). Pro-43 has problems in the Railroad band with pager
IF invasion...

All in all, the 2700 is OK, but I prefer the Pro-43.

> Managers that do otherwise are wrong.

Well...your RS manager is a jewel. :) But all the ones I've delt with made no pretension that the product was not *new,* unless they were selling a display.

> call the district manager. My experience is that the district managers
> feel the same way the manager of "my" store does.

Yer right there. The snake rots from the head down. If you have an honest RS manager, it's because the DM has inspired & allowed that atmosphere. If you're getting shit from a manager, it's for one of two reasons (or possibly both) : 1)The DM doesn't care about anything but the bottom line and 2) The manager doesn't have the cojones to speak up or move on.

Best advice: ask for a product *new* and in the box. Open & inspect it in the store (if the manager gives you shit about doing it beore the sale is complete, then methinks he protests too damn much...but you *do* have a 30-day return. Crack it open immediately after closing the sale.)

Do *not* let the manager con you into "Oh, well, we're stocked out, but I can get you that in two days from the uptown Mall." Yes, he can. But no, uptown mall is not going to send their best, unopened model. They with faithfully repackage a display, or return item, and send it to the store you're buying from.

These managers answer to the same job demands as you & I....and I wish I could tell you not to take it personally when they screw you. Fact is, they are woefully understocked on just about every popular item they carry, since RS is now ruled by beancounters.

However...you SHOULD take it personally. It's your money.

Jay

5007. Modifications for the PRO-2027

Newsgroup: rec.radio.scanner
Date: 1996-09-16 00:00:00 UTC
From: darkshad@phish.nether.net
Message-ID: <51iubf$4do@backup.mnsi.net>
Source record: 223136

Hi... can some one please tell me any more modifications for the pro-2027 scanner. I have already did the modification to get the cellular ban back already.. are there any others ones out there for this brand of scanner. I would really appreciate it if anyone else has any modifications for this type of scanner that they email me at darkshad@phish.nether.net. Thanks alot

Dark Shadow

The offical Undernet IRC #phonesex homepage at
http://www.mnsi.net/~baillie/phone.htm
Lots of great links to various places.. stop by and check it out!

Thanks, Steve...it's been many moons since I've worked at RS, & I'd forgotten that you can order *any* item they sell, and have it shipped to your door from the warehouse. They may give you shit that they can't do that for items currently in stock, but specifically ask for "Gift Express." This is a feature that allows you to buy & ship any product they sell to any address in America.....including yours.

You betcha. I covered my patooty in that opening discussion by specifying the line of sight definition to be clear within one wavelength of the earth or significant objects. Up to three wavelengths are sometimes necessary to clear the Freznel zones, of course, but for beginning hobbyist work, one is sufficient.

> The mathematics are quite simple for calculating first Fresnel clearances.

>best left at that, for this newsgroup.

Yepper. I've studied Kennith Bullington since about 1975 when his work was 30-yrs old at that time. :-) Seems nothing's come along since to explain and model propagation any better. A few have tried, but those guys are hard to understand.

Unfortunately, (and I think we can agree on this), most of the scanners available for sale in Canada are shipped in from the U.S. This means that yours are also cellular-censored, even though it is not required by law.

Now HERE'S a legitimate complaint against us! <g>

What would you do if someone "waved a cheap handgun" in your face?
Nothing, because you'd be unarmed and unable to defend yourself. Here,
the would-be assailant is taking an ever-increasing chance of running
into an armed "victim."

I had legitimate technical input. Maybe I should have posted my flame
as a different message but if your really cared you could have
filtered it out. Instead you join in and add the crap. Expect it in
return. If you are to stupid to understand and can not contribute
then just shut up. Its that simple! Your the one carrying this on.

Most of all you are the nuisance here.

>>I also have experience in radio electronics and have worked in the
>>field and have my own opinion which often differs from Cheeks so its
>>not childish. The fights, maybe but not the technical stuff.
>>I supported my views with technical reasons, you fail to.
>>What is childish here?

>>
>The way that you made your comments, as noted above. Technical

Source record: 223160
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Fellow Scanner Ethusiasts:

Hello!

I am selling my portable scanner, a Radio Shack PRO-51. This particular model was bought a few years ago, but I never really used it since I left for college right after I bought it. The radio is in perfect condition with no scratches/dents/etc. Also included in the sale is a Case Logic portable phone case, which houses the PRO-51 almost perfectly (Hey there is even a seperate pocket for the antenna!). In addition, I purchased a plug-in adapter for the scanner, which allows it to be ran off of household power, or you may charge the batteries with it.

There is not a thing wrong with this scanner; I simply have lost interest in it. I have focused my interests elsewhere, mainly in computing (I am a computer science major). I am looking to sell this as one bundled package.

The total cost for all of this stuff was around $325 ($300 for the scanner, $15 for the Case Logic case, and another $10 or so for the plug-in adapter). I am asking $300 for this package. This price also includes shipping.

If you are interested or if you would like to have more details about this scanner, please send me mail. My address is engleae@nextwork.rose-hulman.edu

Thanks!

Well actually there are a lot of alternatives to RS. I cannot
speak for your particular area, but there are a LOT of ham radio shops
where I live to purchace coax, connectors, etc. And as far as parts,
mail order from digikey or mouser is good if you can wait a week or so.
But there are also many alternatives to that as well. 73 B.

I have been using Cushcraft Blitzbugs for years. Several companies (MFJ, Cushcraft, REC, etc.) make them. Call one of the ham radio stores (Ham Radio Outlet, Amateur Electronic Supply, etc.) and they can fix you right up. Cost is between $5 and $15.

I am not your sales representative Bill. I clearly stated why your
choice of tools is sow very wrong.

Just so you can go and buy the correct tool for your future radio
tinkering GC makes a perfect tool for this job it also works well on
multi turn pots. Its model number AS8608 I bought mine at Active
Components. ANY electronics store will sell the correct alignment
tools necessary to preform most jobs. Look around. Electrosonic, Sayal
Electronics even radio shack sells plastic alignment tools. Your the
Engineer I'm sure you can find a store somewhere.

>>What the heck does "It worked for me" have to do with anything???????
>
>Because it works, and it is maybe the ONLY way it will work.

What?.. only with a metal screwdriver? Yes maybe it does work and
can be preformed with this tool but again, Read the post. I'm talking
about the choice of tools not the method.

How many more times do you need to hear it Billy? soon I'm going to
make you write it down a hundred times and stand in the corner.

>a LOT of different tools in X-301 before I specified the #3 jewelers
>screwdriver.

I'm sure you did. I'm sure you even tried some drugs before getting
on the internet also.

You really are such an idiot Bill. I'd like to see the face of the
first person who drops the screwdriver into the scanner and shorts it
out causing permanent damage from your stupid ideas. I think you
should write back to the match book company that offered your
engineering degree back in the 50's and ask for a refresher course.

You know I heard about your type. Bill you may be able to check to see if a battery still has some life in it by using your tung but I suggest you stop checking your bench power bar this way. 120 volts tends to fry your brain....I know,,I know,, but it works this way. OK.OK..

>
>>Yes I know that...THE PROCEDURE BILL TALKED ABOUT WORKS

5045. INEXPENSIVE Mobile Antenna

Newsgroup: rec.radio.scanner
Date: 1996-09-17 00:00:00 UTC
From: crs1026@inforamp.net
Message-ID: <51ks58$dhb@news.inforamp.net>
Source record: 222837

Are you looking for an inexpensive quick-mount mobile antenna? Can't use a magmount? Here's how I solved this problem.

Parts required:

50 Ohm coax cable - any length to suit (4-8 feet)
1 - coax connector (PL259, BNC, or whatever suits your scanner)
Single-strand speaker wire - 6 inch length
1 - alligator clip
1- pocket AA plastic flashlight - the cheaper the better, so long as it has a sturdy belt/pocket clip
1 pc 1/16" diameter brass hobby rod - available in any hobby shop
Epoxy glue

Instructions:

Tear the guts out of the flashlight (I said use a cheap one). Trim it in length if possible but make sure it will still 'clip' onto a car window.
Cut the hobby rod to a quarter-wavelength for the band you monitor.
Solder the rod to the centre coax conductor.
Solder the piece of speaker wire to the coax shield.
Insert the rod up thru the flashlight body until the coax junction is inside the flashlight. - ie the rod sticks out the top, the coax and the speaker wire stick out the bottom.
Mix the epoxy and fill the flashlight body, encasing the coax-wire-rod junction in epoxy. Let set.
Attach the alligator clip to the speaker wire.
Attach the coax plug to the other end of the coax.

Voila....you open your car window a little, clip the base over the outside surface of the window glass, and shut it as tight as you can. Bend the rod a little if necessary to make it vertical and keep it clear of the rain gutter.

Attach the alligator clip to any shiny metal you can find inside the car (the seatbelt loop on the door stanchion works well.)
Purists will cringe, but I find the ground isn't critical. Just mounting the quarter-wave element outside the car, up over the roofline, does the trick. I sometimes hang another piece of hobby rod, or even a set of keys, from the the alligator clip. Any solid metal object that's big enough to give the radio a ground reference point without itself acting too much like an antenna element willl suffice.

You may find you'll get some wind noise, because the window stays open just a sliver, but it's not objectionable..the scanner will drown out

the whistle :).

Enjoy!
Paul

Robert Modenhaur (dragoman@geocities.com) never bothered to notice that I was NOT the original poster. That didn't stop him from bashing me anyway because I posted that comment from work, where I've posted a grand total of six messages in 3 1/2 years. But contrary to his statement that I don't know anything about the Internet, and contrary to his inability to follow the thread of the posting and note that I was REPLYING to someone who had posted to the wrong wa.* newsgroup and pointing out that it wasn't that big of deal... I will also note that I know a lot about the Internet as the operator of www.hamradio-online.com, probably the #1 ham radio web site in the world. I've also been active on the Internet for about 12 to 13 years, probably longer than 95% of today's net users. Interestingly, we offered an explanation to Robert, in private but he didn't bother to reply to the email.

We are voluntarily working hard, at our own expense, to promote ham radio using a classy web site that features genuine content instead of pointers to other people's web sites containing pointers to .... well you get the picture. We

know we are doing a lot right on the Internet judging from the tens of thousands of people world wide, in 44 countries, who regularly visit our web site.

And once again, the proposed law in Washington State, requiring that the State Patrol certify all mobile radios (receivers, transmitters and transceivers) is a frightening bureaucratic nightmare. We suspect that the text of the ruling was probably written by a mindless twit, but who knows? They may use the poorly written and broad law to prohibit scanners, radar receivers and who knows what else - may be even ham radio? Even if that is not their intent, the ruling is broad enough that it could lead to that. That's why, per the original post, many of us have written our state representatives and the State Patrol asking them to nuke this stupid proposal at their upcoming hearing on October 9th.

5048. Software decoding of FSK modulated signal

Newsgroup: rec.radio.scanner
Date: 1996-09-17 00:00:00 UTC
From: Daniel Ayers <daniel@securicor.co.nz>
Message-ID: <323E1DB0.3896@securicor.co.nz>
Source record: 222840
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.shortwave,rec.radio.scanner

Hello Everyone,

I am developing a program to decode FSK modulated signals using a SoundBlaster soundcard. The plan is to digitize the signal from the radio's audio output and then analyse it in software to produce binary data for further analysis.

I pretty much know how FSK works (this is not AFSK), I have hooked the radio up and digitised some test samples.

My question is: What are the best techniques for decoding the FSK signal into a binary stream?

I have seen this done using a data slicer circuit based on a 741 IC, some resistors and capacitors ... however I want to do it entirely in software using a soundcard.

I know it can be done, as I have a program that receives HF FAX transmissions via a soundcard. I have obtained a suitably fast PC for this application, so the analysis can be performed in real time.

My best guess at this stage is that once you have worked out how to divide the signal into bits (ie. time quantums depending on the baud rate) you need to work out how many cycles occurred in that period - which of course gives you the frequency.

Does anyone have any experience doing this? Any sample code or other technical information?

I'd appreciate any pointers.

Regards,
Daniel.

>types about line of sight for years. I even mention it in my story
>about DX'ing Groom Lake. It IS, however, to bad that it can't be
>explained in lay persons terms. I have tried and failed.

Pure line of sight is easy. If you can see it, it's in the line of
sight. If you can't see it, it don't exist. :-))

> Most people
>think that you HAVE TO SEE it, when in fact you don't always have to.

There are so many rules of thumb that confuse the issues, too. And
diffraction is always hard to explain.

>BTW, You forgot to mention "knife edge effect" in the above
>discussion. :-}

No, not really. Knife edge diffraction is a special case that
involves obstacles and shadows. I just opened with line of sight
calculations and the inferred "spreading loss" that is approximated by
the reciprocal of the square of the distance and modified by an
additional 6 dB loss per octave in frequency.

(Psssssssst! I can't wait for Katz to jump on this!) :-))

HA! That is quite true! I heard someone say once that their logo should be "You've got a question, We've got cheap part-time help!" That is such a pitiful store, although I must admit they have made radio a little more than it could have been by offering the Average Joe the scanners and HAM radios and all of that. But that is definitely true what you said! You've got answers... We're totally stupid! ;)

Easy way is to look for zero-crossings. Either work out how many in a period of time , or time between crossings to get frequency. These may not perform well on weak/noisy signals in the presence of other interfering signals.

Harder ways include writting digital bandpass filter code or transform code (Fast Fourier Transform is fun to play with!) which should perform better in the presence of interference.

Note I'm no expert in this field, just played a bit with a Gravis Ultrasound sound card and the Fast Fourier Transform to decode MSF time signals on 60Khz (which is a bit of over kill, but it was interesting).

I suggest you direct your hostilities towards Bill Cheek if you
feel that strongly about protecting people with disabilities
or medical problems. Bill has (numberous times) poked fun at & made
distasteful comments about people with such problems. Specifically,
he made up stories about me being born without eyelids (wrong), my kids
being bed wetters (I have no children), PjB taking prozac, and MANY
other similar comments were made by Bill Cheek.

HAHAHA, Bill was always calling himself a EE, now he calls himself a CE.

I guess Billy is back to his old tricks of lies again.

> There are NO coils in X-301.

Bill you know better (or at least should). Even if there is are no
coils actually in the circuit that DOES NOT rule out "STRAY INDUCTANCE"
which is a factor in ANY circuit.

Waving a metalic tool (grounded or ungrounded) could have a large affect
on the stray inductance of a circuit.

> >Plastic tools have been designed to do such adjustments.

That's true.

> Bill Cheek
> (Chemical engineer)

hahaaha, before you used to call your self an EE, now you are a CE!!!

Another lie I guess.

Has anyone found a 3rd party replacement battery for the 3000, preferably one that took AA or AAA alkalines? One of my packs just went dead and of course their is no local battery replacment available (no inserts). I'm sure I can get one via phone order, but I was hoping for an alternative. This battery should have lasted more than a year, especially since I use careful charging precautions.

The battery is the only weakpoint I see with this scanner.

Andy

I just got mine that I ordered through Grove for about ten bucks. Works GREAT!

BTW, Radio Shack sells a similar item, but THEY sell it for TWENTY bucks!

Since the BC3000XLT has a stereo jack for the earphone or headphone, you'll get audio out of both sides. Plus it's real cool to fade to just the rear speakers if you want.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, airplanes, armored cars, trains, taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air

Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and

the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove.net

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The 1996 editions contain selected business listings, too, although callsigns are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees,

listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

The Scanner Club is the name of a bimonthly magazine | published by Les Mattson. It is a successor to the Northeast Scanning News and is the official publication of The Scanner Club, a not-for-profit club organization. TSC's main strength is local frequency information, including CTCSS codes. Sample issues are $4 each. A yearly membership costs $24.95 and includes 6 issues. Write to The Scanner Club, PO Box 62, Gibbstown, NJ 08027 for more information.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information

Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to

use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List? |

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner | electronic mailing list, called "scanning." To subscribe, | send an Email message to: majordomo@lists.panix.com |

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (630)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1996 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges. The phone number for repair is also (800)297-1023.

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the

frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. Although UHF versions were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

TABLE 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

TABLE 2. Plectron 700 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. | Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. |
Repair service for the Plectron P1 and R700 models is |
offered by:

Woodson Electronics |
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. *

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

TABLE 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197	47K try 220K.
Radio Shack PRO-2004	R148	47K remove R148 or replace with 220K.

	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is
Electra/Bearcat 20/20	R75 2.7M may be ok as is
Electra/Bearcat 250	R66 2.2M may be ok as is
Uniden/Bearcat 760XLT	R58 22K replace with 6.8K
	or other value.
	(select value for
	the particular radio.)
	Located on pin 14
	of MC3359P IC
Uniden/Bearcat 800XLT	R91 860K replace with 2.2M.
	Located on pin 14
	of MC3359P IC
Plectron P1	R81 180K may be ok as is
Plectron 700	R96 180K replace with 560K

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $13. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies. The 1996 edition contains selected business frequencies, too, but callsigns are listed only for local government and public safety licensees.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp. A 3rd edition is expected soon and will be available from Grove Enterprises for about $30. This second edition is crammed

full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350

Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined

the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There | are several regional scanner clubs, spun off from the | former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is * the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a

local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's

transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than 60 old and new scanner radios and monitor receivers. Other topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 140 scanners and monitor receivers of various brands in my collection. I purchase

most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Grove Enterprises (Brasstown, NC) and Radio Shack repair scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 , Bearcat BC-101 , and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the
scanner or require more detailed information, like series or
parallel resonance, load capacitance, etc.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews of these scanner models
in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT

Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jul 1996 - Uniden/Bearcat BCT-10 mobile

Note: Reprints of Monitoring Times articles are available for $2.00 each (plus self addressed stamped envelope) from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this $2.00.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. DC - 2600 MHz super receiver. AM, | SSB, CW, FM detectors. Frequency readout to 1 Hz. | Electromechanical relays click at various frequency | boundaries, including 400 MHz, producing a clickety-clack | noise -- annoying while scanning banks of mixed band | frequencies. |

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful

search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20

channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life

power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during

search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC230XLT (Uniden): See BC220XLT.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in

Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around

some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get

crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses,

e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden | with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission. See September 1996 Monitoring Times for modifications.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in

early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1995 vintage. Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1984 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals.

Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

TABLE 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast

transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

5072. RE: Mods for PRO2022?

Newsgroup: rec.radio.scanner
Date: 1996-09-17 00:00:00 UTC
From: Beausa@msn.com
Message-ID: <00001ff6+00005e42@msn.com>
Source record: 222864

the Mod for scan speed is done by the following..
Take a look inside the top cover, and on the side of the board toward
the front of the scanner on the right, there is a little blue square chip
that has 3 pins on it. That is your crystal that oscillates at around
2 mhz. If you take that one out, and get a crystal that runs NO
HIGHER THAN 7MHZ, (5 being the highest reccomended) and put the new
one it, voila! you get like 30chan per sec scan speed.
The new crystal should be rated for microprocessor use, or similiar,
and don't worry, the new one will only have two pins on it, compared
to the one that you are taking out, which is 3 pins.
The only thing you have to worry about now, is your scan delay.
If you are interested in building a longer scan delay, get the
scanner modification handbooks by bill cheek, it tells all about them.

HAMFEST/COMPUTERFEST CALENDAR 1996 - NORTHERN ILLINOIS
last updated June 24, 1996

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (708)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale and ARRL for providing some of the information.

SEPTEMBER

September 8 (Sun) - Bolingbrook ARS, Joliet, IL. Info: Ed Weinstein, WD9AYR, 7511 Walnut Ave., Woodridge, IL 60517, tel: 708-759-7005

September 13-15 (Fri, Sat, Sun) - Peoria, IL. ARRL National Convention. Info: Ron Morgan, KB9NW, PO Box 3508, Peoria, IL 61612-3508, tel: 309-694-2649

Sep 21 & 22 (Sat & Sun), Grayslake, IL - Chicago FM Club Radio Expo. Lake County Fairgrounds. Starts 6 AM. Buildings open 8 AM. VEC testing. Info, (708)457-0966. Usually one of the best hamfests in NE IL.

Sep 29 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

NOTES - Computer Central shows

Computer Central computer shows are held at the College of DuPAGE, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 708-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm.

Have my killfiles expired so soon? Anyway...

I agree, a jewelers screwdriver is a poor choice. However, I think your phrase "metal object" may mislead people to believe that nylon or Delrin alignment tools are the only acceptable tool. Many alignment tools do have a metal element that contacts the adjustment screw. The thing is, this metal part of the tool is very small in relationship with the handle to minimize the chance of contact with the hand.

Also, I may be mistaken, but I think you mentioned a Radio Shack part number for a tool. Let me just suggest a link to another source for tools.

Techni-Tool

Can I get a straight answer as to why there are no mods available for the
BC 210XLT? In this super electronic age, it seems unusual that there are
no mods of any kind available for this scanner.
If anyone can help, please respond at tbrutis1@aol.com & tom.miler@oho.com

Thanks In Advance for any assistance.

Cheers,
Tom

Actually... While it *may* be a `supposed?' good idea not to do it I am reasonbly certain that you can go into *many* shops that are staffed by ICET technicians *and* into many *other* `labs' and `workareas' and find both techs and engineers doing exactly that. IE: Using metallic intruments to adjust `trimmer caps'. While just about *every* one of the people doing that `sin?' has been taught that it "isn't the way it's done in theory" they *have* found out that it can be done that way 99% of the time in `reality'. Please... Remember that there is a *big* difference between `theory' and `real life'. (Prime example, though fairly off topic, is the bumble bee. In theory there is no way it can fly aerodynamically speaking. But! Try tell it that! {BSE GRIN!}) In the particular case that Bill presented it *isn't* `ill-advised' since there is *nothing* that it affects by it's *presence*. (By it's *use*... IE: By whomever is on `the other end' rotating it... Yeah... It *does* affect *something*. {CHUCKLE!} No argument there from me.)

I don't have my ScanFan or RS book with me, but you can bet it's trunked up in the 800mhz range like it is here in Riverside county.

I heavly suggest in looking into the ScanFan book at a Crown super store, or the like. It'll give you everything you could possibly want, as long as you have the scanner that can get to those frequencies! :)

Hi! I have a Bearcat BC2005 scanner for sale; 400 channels in 20 banks, 25 MHz - 1.3 GHz (almost continuous coverage; cellular unblocked). Unit includes box, manual, AC charger, rubber duck, case, and a 2nd battery pack (which needs rebuilding).

$250, OBO, + shipping. I'm motivated ...

I found the same thing here in NC.
I bought $10 worth of hardware and told the salesman to add
a catalog to the bill.

He didn't add it and put the catalog in the bag.

>Does any one have a suggestion?
>Thanks,

From my FAQ, "Buying a Used Scanner:"

[...]
Sonar:

Sonar made several crystal controlled scanners and
channelized monitor receivers which shared the same RF
circuitry. Each radio was housed in the same size metal
case and worked on both 120 VAC and 12 VDC. The models
differed in the number of channels, the band coverage, and
whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require
parallel resonant crystals different from the common series
resonant crystals used in Regency and Radio Shack scanners.
Some Radio Shack crystals will work in Sonar units, but more
often they oscillate a few kHz off frequency and are
unsuitable unless changes are made to the oscillator
circuitry. Therefore, beginners should avoid these radios.
Typical Sonar squelch has long time constant causing a long
noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 -
50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no
scanning. Early models are identified by an 11 pin
connector on the rear and they could be used with an
optional NiCd battery pack and charger which bolted to the
rear panel. Later models used Cinch Jones connectors with
flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and
FR-105 monitor receivers. Manual channel selection, i.e.,
no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority.
Recommend you avoid these models as there is no way to

lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering
various combinations of 3 bands. Each channel could be
locked out. Channel 1 priority.

According to who (or whom) are you an engineer? You have NEVER been
able to post a organization or school which has awarded you with a
certificate or document authorizing you to call yourself an
"engineer".

You certainly are correct, there are big differences. There are
wanna-be engineers & then there are real ones.

I just picked up and old Sonar FR-104 at a flea market. So far it checks out, but I need lowband crystals for it. The local Shack salesman says that his crystals will work, but I have some doubts. The 2nd oscillator frequency is 10.245, and a friend stated that most Shack crystals will NOT work with that. Does any one have a suggestion?
Thanks,
Pete (mongo@bestweb.net)

I am trying to use a voice activated tape recorder with my B.C. 200XLT scanner. The problem is that the output of the jack has a "hum" on it that sets off the vox on the recorder. The hum stays the same, no matter what the volume is set on. I am not sure, but I think it is the same hum that is barely audible on the speaker of the unit. Any suggestions on how to "filter" it away so that I can use the recorder?

Thanks,
vince

>Engineer I'm sure you can find a store somewhere.

It's not ME with the problem, Katz. It's the hundreds of owners of
the PRO-2004/5/6 who will have the problem. I have more alignment
tools than you have hairs on your head. My doing the job is one
thing; others doing it is something else.

There is absolutely no sense in specifying some obscure alignment tool
that *could* break......or *could* break the trimmer in X-301, when a
common, ordinary, garden-variety, plain-jane tool already exists, if
not in the hobbyist's tool box, then at the corner Radio Shack store.

The #3 flatblade jewelers screwdriver is perfect for adjusting X-301.
I didn't specify it for anything else; I didn't talk about anything
else; and I prepared the procedure for everyone from the entry-level
hobbyist to the grizzled expert. The #3 screwdriver is perfect for
this job, and that is all we are talking about. When I write up a
procedure for something else, if a critical tool is involved, I will
specify whatever works for THAT job.

Simple exercise in futility is to assume that the 90% percentile of
readers will all run all over town looking for some obscure tool.
They won't. So if I were to have specified some obscure alignment

tool, the chances of people wrecking their X-301's would rise dramatically, because they'd try to make something else work.

> What?.. only with a metal screwdriver? Yes maybe it does work and
>can be preformed with this tool but again, Read the post. I'm talking
>about the choice of tools not the method.

Yes, the choice of a #3 jewelers flatblade screwdriver is perfect for the X-301 adjustment.

> How many more times do you need to hear it Billy? soon I'm going to

>on the internet also.

Huh? I don't do drugs, Katz. But where and how does that enter into the conversation?

> You really are such an idiot Bill.

Am I now?

> I'd like to see the face of the first person who drops the
> screwdriver into the scanner and shorts it out causing permanent
> damage from your stupid ideas.

So would I. That's pretty far-fetched, and if it were to happen, I can't imagine any but a klutz like you doing it, and I would laugh at you. No one else would do it.

>I think you
>should write back to the match book company that offered your
>engineering degree back in the 50's and ask for a refresher course.

Good grief. You poor, silly fellow.

>>I wrote the procedure.

>And a lot of other garbage!

My my, aren't we getting a little jealous, Katz? I'd sure like to see you write something. I'll help you find a publisher with a spell checker, if you have the lugnuts to put your prowess to paper.

tbrutis1@aol.com (Tbrutis1) wrote:

>Can I get a straight answer as to why there are no mods available for the
>BC 210XLT?

Sure. No sweat. Except that the answer is going to be a little blunt
or direct. Keep in mind that I do not invent the truth - I just
report on it - as I see it. If others see it differently, then take
their input right along with mine for perhaps an even broader
perspective.

> In this super electronic age, it seems unusual that there are
> no mods of any kind available for this scanner.

It's "unusual" ONLY to the extent that if you want "mods", you haven't
developed any for it, never mind why not. You could be busy.
Handicapped. Possess no equipment or requisite materials. Or you
might be incapable of researching and developing such "mods". The
thing that matters is that you WANT mods, but you haven't developed
any.

Ok, so you come into the public forums; snoop and hunt around; and
don't find any. So you ask why not. And we come full circle: because
YOU haven't developed any mods for the BC-210XLT.

Ohhhhhh, but wait.....you were HOPING someone else had, right? Oh,
ok, that's different. But this is where the "rub" comes. A "mods
developer" for the BC-210XLT has to possess four unique capabilities:

(1) must be technically astute and properly equipped .
(2) must actually own or have access to a BC-210XLT
(3) must be able to write it up in a manner understandable by others
(4) must be dissatisfied with the scanner and WANT to improve it
in certain aspects

"Mods" for the BC-210XLT are not "available" because of (3) above. No
one has written anything for and/or contributed to the public domain.

So why not? Well, now it gets easy. No one who is CAPABLE of
developing "mods" for the BC-210XLT is going to bother to own one in
the first place, nor to spend his time messing with a loaner. There
are two reasons for this: (1) it is not a very popular scanner; and
(2) it really isn't capable of much of anything aside from the
ordinary, run-of-the-mill analog mods.

In other words, there is nothing you can do to the BC-210XLT that
could be found in a short text file on the Internet - no "clip-a-

diode", or "add-a-resistor" kinds of things to turn that puppy into a rip-snorting behemoth of a TurboWhopper. Only a very rare few scanners have that latent capability, and frankly there's just one, the PRO-2004, where clip-or-add-a-diode unleashes cellular, adds 100-channels; and boosts the speed by 25%. No other scanner offers so much for so little.

The subsequent PRO-2005, PRO-2006, and PRO-2022, as well as the later PRO-2035 and PRO-2042 proved to be very hackable, too, only a bit more effort and cost were involved. Handheld scanners, including the PRO-34, PRO-37, PRO-43, PRO-39, and BC-200XLT proved hackable to a degree. But really, that's about it.

A very few scanners CAN be 'turbowhoppered', that's for sure, but only at someone's great expense of time and money, not to mention the wherewithal to write it all up.

I've written three books and five years worth of a monthly newsletter on the arts, sciencies, and methodologies of scanner hacking. The easy, simple-to-do hacks take a few pages, at most, out of many hundreds of pages that I've written over the years. The rest of my mods can go anywhere from a few pages to 50 pages or more, with charts, tables, photos, and graphics.

In summary, it's the quick-'n-easy hacks that you're apt to find on the Internet....public domain material. And THAT material is limited to only a few select things for a select handful of scanner out of over 500 ever made. You should not be disappointed to find nothing for your BC-210XLT. It is not the kind of scanner to attract the attention of engineers, technicians, and astute hobbyists; nor is it worth any serious time spent in the pursuit of the Impossible Dream.

Somehow, when the PRO-2004 came out in late 1986 and proved so highly hackable, people got the idea that all scanners were filled with latent goodies and power just waiting to be unleashed. Nothing could be farther from the truth. In a word, if you're not satisfied with your scanner as it is, then you bought the wrong one.

Now since I owned and took a personal interests in most of the above mentioned fine scanners, I went on to develop a number of convenient and sometimes weird analog hacks....most of which can be done to ANY scanner, because portions of all scanners are all about the same. Catch-22 is that I can't possibly write detailed instructions for every scanner ever made. I have to leave it to the users to check out the mods I have developed and then apply them to their own rigs.

I am happy to help by providing specific answers to specific questions, should you have any. There is a lot that *can* be done to your BC-210XLT, but nothing that's been written up as far as I know.

Are you from Norway and own a radio scanner?
Then why don't you join us?

We can promise you big activity and great news!

All our activity is based on E-mail connection where the hole team
participate in any scanner related subject!
Frequencies is constantly shared with no secrets from each other!
We have about 2200 norwegian frequencies to share!

You MUST though own a radio scanner to join us!

E-mail

mailto:ketilg@gudmund.vgs.no
for more information!

Er du fra Norge og eier en radio scanner?
Da har du muligheten til ï¿½ "joine" vï¿½r aktivitet innen Radio Scanning!

Vi kan love deg en spennende og ikke minst lï¿½rerik "hobby" med nyheter
og oppdatert stoff!

All vï¿½r aktivitet er basert pï¿½ e-mail kommunikasjon hvor hele teamet
deltar i scanner relatert stoff (obligatorisk)!
Frekvenser deles sï¿½ snart de finnes og til nï¿½ har vi ca. 2200 norske
frekvenser!

For ï¿½ delta Mï¿½ du eie en scanner!!!

E-mail

mailto:ketilg@gudmund.vgs.no

I am looking for a 2004,5,or 6, but dont know which one I should shop for. I am going to use it for vhf,uhf,cell etc scanning. I would even like to get into monitoring my local airport. SO, it seems that most mods, and ad-on boards and computer linkups are for the RS scanners(not including the upperend stuff) I have decided to look for one of those. Are there any to avoid? I am assuming that all are cell modifiable if they havent been done already.

Thanks for your advice.

From: Katherine.Schubert-Knapp@ci.seattle.wa.us
Message-ID: <51n6e4$lp1@lal.interserv.com>
Source record: 222894

CITY OF SEATTLE COMMUNICATIONS ADVISORY
Sept. 17, 1996

On Saturday, Sept. 21, 1996, the City of Seattle will conduct a two-and-a-half-hour emergency exercise testing some of its neighborhood-based disaster readiness and response teams, as well as the amateur radio system that supports the teams. The test will involve a variety of City locations but activity will be focused at three sites in West Seattle.

The drill begins at approximately 9:30 a.m. and is expected to conclude around noon.

Members of two West Seattle SDART (Seattle Disaster Aid & Response Teams) neighborhood groups and amateur radio operators from Seattle ACS (Auxiliary Communications Services) will participate in the City-organized training exercise, which will simulate an earthquake. The drill will assess how the neighborhood teams respond to their SDART training and how the amateur radio system established to serve as a communications resource to SDART functions to provide information to the City's Emergency Operations Center (EOC) about the status of SDART neighborhoods.

Because messages will involve radio transmission, it is possible that on Saturday you may pick up information related to the emergency exercise on scanners or hear information related to the drill from some other source. This advisory is to alert you to that possibility. Radio messages that are part of the exercise will begin and end with the statement: "This is a drill." These messages will be transmitted over two frequencies: 146.96 (the primary repeater) and 441.80 (may be used).

If you have any questions about the exercise or wish to confirm reports of an emergency situation within Seattle on Saturday, Sept. 21, between 9 a.m. and noon, please contact the City's Office of Emergency Management at (206) 233-5076.

|The Murate Erie filter (F3) inthe old board is a
|CFWM455F with the letter "U" under the 455F and the new IF board has a CFWM455F BUT
|it has a "V" under the 455F. I think it has to do with the skirting of the
|filter(What ever skirting is).

I assume "skirting" is a contraction of "skirt selectivity" which is simply a measure of "shape factor" of an IF filter i.e. the ratio of the selectivity of the filter measured at two points e.g. -6, -60db or whatever the manufacturer specifies... I think Collins mechanical filters are specified at the -6, -60db levels, but the Japanese ceramic filters may typically specify at something other than -6,-60db due to different stop-band attenuation characteristics (for some reason -50db comes to mind)...

>My best guess at this stage is that once you have worked out how to
>divide the signal into bits (ie. time quantums depending on the baud
>rate) you need to work out how many cycles occurred in that period -
>which of course gives you the frequency.

I'm afraid you haven't quite understood how FSK works... in combination
with an FM transceiver.

When you get the signal from the radio's audio output, assuming it is
an FM radio, you won't get "so many cycles in that period", you will
directly get voltage levels that correspond to the frequency of the
of the received signal. So, the decoding of the FSK signal is simply
a matter of slicing it at the correct level and finding the correct
place to decide if it is a '0' or a '1'.

There are two things you will have to do: find the correct slicing level,
i.e. the zero axis in the signal. That can be done by low-pass filtering
or by taking the peak value in positive and negative sense and calculating
the halfway point from that.

The other thing is re-generating the bit clock to find the correct sampling
points for the data (you don't want to sample near the bit edges).
That is done using a software DPLL.
Of course your first guess is to use a sample interval equal to the bit
rate, and then you PLL that to the actual received signal to overcome
tolerances in the bitrate and to lock at the correct phase relationship.

From: donknow@datasync.com
Message-ID: <51n9bo$rbl@osh1.datasync.com>
Source record: 222899

Yes, a scanner could be used as a bug detector, IF;
1) the bug was transmitting in the freq detectable by the scanner
2) the bug was xmitting fm
3) the bug was on an isolated freq, not nested next to a commercial station
4) the bug was actually xmitting an rf.
Considering that 1) most bugs operate in freqs not covered by scanners,
2) there are *many* ways to bug without using rf, and 3) bugs can be
video as well as audio;
the probability of finding a bug by using a scanner is pretty slim.
Aside from the length of time spent in scanning the range of 100kHz to
2GHz, there are several types of bugs that do not xmit on rf.
I hope that answers your question.

Dear fellow,
As a part of a research programme carried out in the Computational Vision Group at the Dept of Computer Science, University of Reading, UK, a visual perception test is being circulated via the Internet, the result of which will be used in my thesis (and will be sent to you if you so wish). The test contains a number of images which you are requested to interpret without any clues.
I would be grateful if you could spent a short time (about 5 min) to fill in the form/questionnaire for this test which is provided at the Web page at the following URL:
http://www.reading.ac.uk/~ssrmrouh/surv_tst/HTML/psy_tst1.html

Thanks in advance,

Behrouz M-Rouhani,
Research student in CAD-based vision, Dept of Computer Science, Reading Univ., UK

PS. The test can be done by EVERYBODY with normal vision perception. Hence, you/your newsgroup have been selected at random.

Hi Paul, this was recently posted the the UK scanner listserver

For those interested in UHF-SATCOM and the more technical issues I
suggest pointing your browser to http://bbs.itsi.disa.mil:5580/T3564.
There are some interesting MIL-STD documents available here. There is
complete UHF SATCOM freq-list in Appendix C of m188-183.zip This
document is about DAMA networks on SATCOM, all very
interesting if you are in to this sort of thing.

Cheers PaulJ

nyo41ed@aol.com (NYO41ed) wrote:

>Are the State Police still simulcasting T-pke operations on 155.19? or did
>they go to 800 completeley? IF so, please post freqs I will be traveling
>the entire lenght of the turnpike in 3 days.

>THANKS

Hi,

The NJSP turnpike comms are now on the 800 Mhz trunked system.
Simulcasting is no longer being performed. Check my web page for all
frequencies for the Troop A (South) and Troop C (Central) trunked
systems.

http://www.voicenet.com/~jcardani/sjscan.htm

However, you can hear 90-95% of the Turnpike talkgroups by monitoring
only a few frequencies. This has been the case since the move to the
Type IIi system (from Type I) I can let you know these for Troop A and
C . Troop B (North) is too far for me to receive, but I can make a
reasonable estimate with the info I have.

These frequencies below would be the PRIMARY ones, if they are active,
the overflow would go to the other trunked freqs. Again most of the
action would be here!

Troop A - South

855.4375

On this freq you can hear the following talkgroups:

A1-14 Moorestown Station & Turnpike Operations
A4-14 Turnpike (South) Car-to-Car

Troop C - Central

867.6625
868.1375

On these frequencies you can hear the following talkgroups:

C3-14 Cranbury Station (formerly New Brunswick) & Turnpike
Operations
C6-12 Moorestown Station
C6-13 Newark Station
C6-14 Turnpike (Central) Car-to-Car

The reason you can hear ALL of the turnpike comms on troop C is because of the overlap of the Moorestown and Newark coverage in the Troop C system area.

Troop B - North

867.7625

On this freq you can hear the following talkgroups:

B2-14 Newark Station & Turnpike Operations
B5-14 Turnpike (North) Car-to-Car

Moorestown station units cover the area SOUTH of Exit 7A
Cranbury station units cover the area between Exit 7A and 14
Newark station units cover the area NORTH of Exit 14
Operations covers maintenance for the entire turnpike

The Garden State Parkway also operates similarily:

Troop A - South

855.2125

On this freq you can hear the following talkgroups:

A1-15 Bass River Station (South)
A4-15 Parkway Headquarters

Troop C - Central

866.6125
868.5125

On these frequencies you can hear the following talkgroups:

C3-15 Holmdel Station (Central)
C6-10 Bloomfield Station (North)
C6-11 Bass River Station (South)
C6-15 Parkway Headquarters

Again the reason you can hear ALL of the parkway comms on troop C is because of overlap.

Troop B - North

866.5625

On this freq you can hear the following talkgroups:

B2-15 Bloomfield Station (NORTH)
B5-15 Parkway Headquarters

Finally the Turnpike and Parkway may still be using 155.46 for a TAC-PAC Radar channel. Not certain though.

Any further questions you can email me.

There is a priority field in the NAM data. In emergency situations the
MTSO's (the switches that talk to the radio equipment in the cell towers)
can be told to restrict access to higher priority levels. Militia types
might want to be able to enable higher priority on their phones to keep
FEMA from shutting 'em out when the Black Helicopters land and NATO & the
UN take over the Government.

These are aftermarket mods. Rather simple to do. Cheek published an article on this newsgroup about where in many scanners to tap the discriminators output.

What limits are you entering? If there are any blocked freqs between
your search range then it will give you an error. If your trying to
scan cell phones then try 895-915, that gets pretty much most of 'em.
This is assuming you have a bearcat 200xlt.

An oldie but goodie..... electronically identical to the PRO-34 handheld scanner, believe it or not. And a close, close match to the PRO-37 handheld scanner. Mods for any one of these will work for the others.

>The only mod I can find on the net is the cellular restore mod.

THAT is the ONLY simple mod for these scanners. Just clip-a-diode and you're done. The rest of the several dozen possibilities involve some extensive writing, graphics, pictures, etc, that you're not likely to find in a public domain archive.

>Does anyone have any others?

Dozens of possibilities, yes.

> I am looking for increased scan speed,

Replace CX-1 with a 3.57 MHz quartz colorburst crystal.

>beep delete etc

Remove R-158 or R-133 or C-119. Better still, replace R-132 with a 10-k trimpot and adjust for desired volume, including none.

5135. INS freq use NJ, NY, CONN, PA, MD

Newsgroup: rec.radio.scanner
Date: 1996-09-17 00:00:00 UTC
From: "L. G. Shirley" <lgshirley@worldnet.att.net>
Message-ID: <51nc22$2h2@mtinsc01-mgt.ops.worldnet.att.net>
Source record: 222927

Hi, I'm looking for the newer INS freq's and confirmation of older ones.

I have heard them plenty of times in NJ but would like to have a more complete freq list should I have the opportunity to travel. Here is what I generally monitor:

NJ - 162.825
163.625
165.825/168.925 This one came on line back around 5/4/95. Techs were mobile on Rt 23 and one individual was at the base monitoring the signal. This is called the 'North rptr". (Newark, NJ HQ) Previously this was an FBI rptr channel in the NJ/NY area.

The signal gets out well into North Jersey and probably New York State as one of the techs lived on the border and was able to hit the rptr with only minor background static.

They use Moneyrola$ radios and they are scanning capable. SPEN 1 - 154.680 and SPEN - 2 155.475 are constantly scanned. They are configured for simplex (direct) and rptr operation on 165.825. They are also DES capable.

NY - 162.900 ?

CONN - 163.650 ?
168.825 ?

PA - ???

MD - 163.675 ?

Some others listed to INS as active are 162.975 163.725 163.750 168.975 Very little is printed about INS. Locally I've heard them work with a county and local PD and have heard some good surveillance activity they preformed as they aided the USPS.

Any info is appreciated especially freq's. E-mail if you prefer not to post anything, thanks.

Regards,
Lou Shirley

I'm curious, Daniel, , , , Why are you trying to reinvent the wheel?
If it is just an excercise in design and building, I can understand
it. There is, however, software and hardware on the market that does
just what you are trying to do. Try the "Personal Code Explorer" and
it's software. I think that it may be what you want.
This isn't a shot, just curious, , , :-}

I've forgotten where this came from, or who posted it, but I think
that it's probably time to re-post it again :-}
My apologies to the originator :-{

If you are a scanner enthusiast like I am, you read as much as you
can find on this interesting hobby. Among the listings of tactical
names used by the Secret Service on their radios, are such code
names as "Traveler", the code name for Ronald Reagan when he
was president. The following is a proposed list of code names for
the Secret Service to use during the November elections:

Bill Clinton: Big Mac (He likes Mac Donald's)
Bob Dole: Pineapple (Dole Company)
Phil Gramm: Cookie Monster (Graham Crackers)
Pat Buchanan: Crossfire (He worked for CNN)
Steve Forbes: War Bucks (Little orphan Annies uncle)
Allen Keyes: Open Door (Keys open doors)
Charles Colllins: Patriot (American Patriot movement)
Libertarian Candidate: Skeleton (wants govt. reduced to skeleton)
Ross Perot: Pale Horse (From Revelations, predicting Armageddon)

here are some of the ACTUAL call signs, , , anyone care to add
anything?

Dole, , , , , , , , PATRIOT
Kemp, , , , , , , CHAMPION
Mrs Dole, , , PIONEER

Hidden only in the sense that since they are generally unprotected on
Public land, they don't want them vandelized. The people I talked to
were VERY suspicious of the reason that I wanted to know. They have
had sevearl machines that were stolen.

That's all the power you need. The signals here just BANG in, and they
are about 15 miles away (LOS). And although I assumed that they were
directional, the lobe is very wide and horizontally polorized.

MAJOR SNIPPIDY SNIP SNIP
Thank you for your input. It is obvious that you know a hell of lot
more about earthquakes than I do . My method of monitoring was
intended as a low budget way to see the quakes, without major
investment, and was actually a response to Bob Groves response to a
guy (Dick Milligan) in Squim, Washington who asked the question of how
to monitor these devices. I'm afraid that Bob shined him. Maybe he
was just to busy for a considered response. My method is not for
actually "measuring" the quakes, but rather just a method to see them
and go "WoW"! :-}

Gosh guys, its just fabulous getting back into the *swing* of things here in the group! You've probably noticed that I've been away for a while. Well, I've been some time on Cuseeme where I've made some new friends named Bear, Rough rider, and my new sweetheart... *Bull Dog*!!! Now PjB, and Dan, don't get upset! I'm going to teach you the new ways of love that Bull Dog has taught me! We can be one happy family again! And now I think I have one more new member for my *stable*. Yes Ron, Its *YOU*. The way you stand by me and help protect me from that bad, bad, bad, Cheeks guy, it can only be love! If you would only savage *me* they you have savaged the Cheeks guy with your post this week! And our photos have laid him helpless to our power! But enough of the Cheeks guy thing. Lets think of our future! I've included a snap of the *new* (and much, much happier!) John Mackey. I'm back in my old stomping grounds now, so all of you *stud-muffins* feel free to write, phone, e-mail, or just drop by to try out the *new me*. See you on CuSeeme!!! XOXOXO John

Drew,

Right! Well, Kinda... It really isn't about exchange rates or buying power... it's about clout. We Arrogant Americans never have to ask, "American or Canadian Dollars?" Hell, we wouldn't even know the exchange rate if it wasn't printed on the spine of a paperback book. THAT, my friend, is what it's all about. As neighbors, it probably wasn't a good idea for us to use the same name for our different units for the measurement of currency, but we did. As it happens, around the world or around the block, the word "American" is supposed whenever people see "$" or "dollars".

My first encounter with Canadian money came in 1977, when, as a child on vacation (in Florida) with my parents, I was given a Canadian bill as a rememberance from a girl I had met. The Canadian bill had a red hue rather than good old green, and instead of a picture of a great elected official, it bore the likeness of a woman who gained celebrity by having not yet died.

Oh, and about the girl. I gave her a really cool seashell I found next to my foot (I had looked down in shame at not having a bill to give her). She gave me a big kiss on the cheek, evidently quite content with the exchange rate.

Bob,
Try this site for pin outs.
http://www.cpl.uiuc.edu/~tpeckish/appendix.html

Also I am in the process of detailing how I removed my flat cable jack interface and installed a rj11 telco jack in the 8K.
I removed the flat cable on my edco interface. And added a two foot telco cable with rj11 plug.

I have been using this set-up for a year now and it works great.
My site is at..
http://jsl.com/~stuver

I took some digital pictures today and I am building the page tonight. Check it out later.

Actually, it's generally illegal in the US to manufacture amps capable
of operating in this frequency range unless you have certain types of
FCC approval. This was changed a few years back.

The longer it is the more signal loss. More loss than RG8 or other fatter
cable.

5158. Here is mod for the bc175xl

Newsgroup: rec.radio.scanner
Date: 1996-09-18 00:00:00 UTC
From: Brad Wicks <brawicks@netnitco.net>
Message-ID: <323FD4F9.45D7@netnitco.net>
Source record: 222726

If you have a 16 channel bc175xl, you can add 4 memmory channels to it very easly. If you have cpu# 1115a or 1115 you can do this. On the top left corner of the cpu count down 5 pins. If you can read the name on the cpu and it is up Right and then you go to the left side, you are at the place for this mod. Beside the 4th and 5th pins on this side, there is a solder pad, an 1/8 of an inch to the left of it is another solder pad. make a solder bridge between them and you will get 4 more memmory channels.

Brad

According to the information published in August Pop Comm there are 7 frequencies shared.
462.5625
462.5875
462.6125
462.6375
462.6625
462.6875
462.7125

Is this information incorrect?

Barry,

That isn't what bugged me about this ad... Forget that it goes against the non-comercial ideal of the newsgroup... forget that the guy sent it three times... what bugged me was that he didn't give us the one piece of information that we need: Is it a 20-145A and thus modifyable?

So now, we have sent two messages regarding his three. That's a total of five thus far, when just one would have done the trick. Come to think of it, I really shouldn't post this. But hell, I've already written it.

Source record: 222776

>>I should have used a soft case or something. Is there a softcase made
>>just for the 43?

See if Howard has any of these left - they're the best you'll ever find:

FROM: Howard Bornstein
Design EQ
P.O. Box 1245
Menlo Park, CA 94025

I now have limited supplies of custom-designed, hand-made
leather cases for the Radio Shack PRO-39, PRO-43, and
PRO-44 handheld scanners.

The case is handmade out of fine, black, Corinthian leather
(ok, I'm kidding about the Corinthian part) and fits snugly
on the PRO-39/43/44. The case has cutouts for the display,
the keyboard, and the power ports. It also has sound
holes over the speaker.

The scanner slips into the case without having to put the
belt clip through a slot. The case is designed to stay on
the scanner all the time, so, to that end, there is a
velcroed flap at the bottom that allows you to open the
battery compartment and change the batteries without ever
having to take the case off. There are also slots in the
back of the case if you want to loop your belt through it
for greater security.

With a little "training" the scanner in the case will stand up
on end without any problem.

The cost of the case is $29.95 plus $2.00 S&H. If you're in
California, you'll need to add $2.47 state sales tax (sorry).
Since the cases are handmade, it may take as long as 3-4 weeks
from receipt of your check or money order. I will try to speed
this up as much as I can. The cases are sent out via airmail
and satisfaction is guaranteed.

To order, send a check or money order to:

Howard Bornstein
Design EQ
P.O. Box 1245
Menlo Park, CA 94025

You can reach me by phone at 415-328-9181 afternoons PST or via CompuServe Email (ID:76174,637.) If you are ordering from outside the US, please drop me email, because the postage will be a bit more. Feel free to contact me if you have other questions about the case, and thanks very much for your interest.

Regards,
Howard

Hi! My previous post had a typo in it; the scanner I'm selling is
a BC2500XLT, not 2005.

I have a Bearcat BC2500XLT scanner for sale; 400 channels in 20 banks,
25 MHz - 1.3 GHz (almost continuous coverage; cellular unblocked). Unit
includes box, manual, AC charger, rubber duck, case, and a 2nd battery
pack (which needs rebuilding).

$235, OBO, + shipping.

Howard,
I have one of your cases on my pro-43. I have had it a couple of years now. It is a very excellent case. I like the heavy duty leather. It has really protected my scanner from scratches, ect. I take my scanner almost everywhere with me, and It still looks like new, thanks to the case.

I would highly reccomend this case to anyone. It is well worth the cost,as it compares to the cases that are used on "professional" handie-talkies. I know my scanner would really be beat up without it!

Thomas

: What follows isn't likely to be optimal, but it is simple:

[SNIPed an interesting idea...]

Matthew, I'll give you're ideas a try and see how it works.

I have been playing with full-blown FFTs and getting very good results on
low speed data. It's fun to tune a SSB Rx to some aviation beacons
that send very slow CW idents, and look at the spectrum. A single
frequency for the carrier, and to single tone side-bands as the id is
keyed :-) Proof the sidebands are real :-)

>No Bill I am not "A" news cameraman, I "WORK" as a news cameraman.

>I don't live my job, you do. Look at the difference.

Ahhhhh, I see; you are NOT a news cameraman. WHAT exactly are you?

Ok, you succinctly said what you are NOT and what you PRETEND or ACT
to be. But you left out what exactly you ARE? What are you?

>>I am an engineer across a variety of disciplines, including radio and
>>telecommunications. I do not pretend to tell you how to hold, focus,
>>and zoom your camera.

>engineer or Engineer? Is it a title (as in a noun) or an adjective?

Let's don't play word games. As for titles, sometimes I am CEO.
Sometimes CIO. Sometimes CFO. Sometimes administrator. Sometimes
assembler. Sometimes designer. Sometimes drafter. Sometimes
engineer. Sometimes floor scrubber and bottle washer. Titles are for
those who don't know what they are supposed to be doing.

>Either way, does it mean you know what your talking about, or that you
>know more about Radio Electronics then anyone else?

No. But I do know infinitely more about Radio Electronics than YOU.

> Most of all it does not mean that yours is the last say.
> Its means NOTHING here.

No. It only means nothing to YOU. "Last say" goes to whoever takes
it, I suppose. MEANING is like beauty....it's in the eye of the
beholder. If you take no meaning from what I say, that's certainly
your perogative. You do not speak for others, however.

>>You have made a sustained practice of attacking the sum and substance
>>of my 33+ years in the radio communications academia and field .

> Bill, when you attack people attack back, read on....

I don't attack people, Katz.

> Most people would say they work as a "x"

Really now? I have seen ONLY YOU say you are a 'pretender'..... No
one else has made a say on that issue.

>your say you are an "x" Because you ARE your job,

I don't have a job, Katz. You do, though. Obviously.

If you are inferring that my work is my Life....well, that's got a lot
of truth to it. I am an artisan; a craftsman; and I ENJOY what I do
to the fullest. And..... I *am* very, very GOOD at what I do. It
just so happens that my hobbies, my business, my arts, my crafts, and
my higher life's pursuits are all rolled into one area called
COMMUNICATIONS of which radio is a part. I work radio. I play radio.
I sleep radio. Yeah, it's my life. At least it is a major segment of
my life. Communications is the parent shell of that segment. You
have no idea of what I do outside of scanners........

And I'll tell you something else, Katz. Everything I do is FUN else I
don't do it. I wake up in the morning utterly delighted to have a
day's work ahead of me. I retire in the wee hours, reluctant to let
it go for a few hours of sleep. After all, I can get all the sleep I
want after I'm dead. I do not know the meaning of the word, "boredom".
My days are filled with excitement, vigor, fun, and satisfaction.

> anything said contrary to your "views" are taken as a personal attack.
> An attack against you, instead of your reasoning.

Oh, you silly, silly boy........

> When you feel this happens you attack back then the fights start.

Keyword: "back". Yes, I have been known to fight back. I am not
known to be the aggressor.....the initiator of attacks.

> You have to learn how to separate the two.

Ha ha ha ha! Really now? Separate my Life from my work? You have
got to be kidding?

> If you can't then your wars will never end.

So? Wars in general have not ended, either. There is always some
Sodom Who Sain out there starting something.

> Your History speaks for itself.

Yes, Katz, it sure does. Pity that you know so little of it.

> Note, The Wars here and on other forums have always been "Bill Cheek vs.
>Someone" all these little fights others have here, including with me,
>all started with fights involving YOU.

We're talking TWO MONTHS, Katz. Not 50 years. And you're inferring that it's OK to start a fight, but not OK to end it. The clue is don't start one.

>You also take great pleasure sitting back

Oh no, Katz. I am not a spectator. I am a participant.

> and laugh at how your fights spring off into different directions.

I laugh at you a lot, yes.

> The <Grin><Giggle> comments, etc. are a perfect example.

Yes, you are a very silly boy....almost a comedian. I'd rather laugh at you than shoot at you. Laughing is good for the soul.

>This becomes a form of entertainment for you.

Yes, you ARE very entertaining, Katz.

> Understand Bill, many will eventually stop the fights with you.

Cool. There will be no sustained fighting from me, then. I am all FOR talking radio and scanners in this forum.

>Including me.

When?

> The little offspring fights that started with you will also end.

So will the ticking of the clock, Katz.

> But, your fight will always go on.

Maybe. But it will be beyond your ability to understand. My fight will go on, because I am sworn to eternal hostility over every form of tyranny over the mind of Man. As long as it exists, I will combat it.

As long as there is a Sodom Who Sain, a Fiddle Castrato, a Mo-hammer Guh-Daffy, an Idi Amin Da-da, a Khmer Rouge, a communist, a marxist, a socialist drawing a breath, and a divisiveness of politics, race, religion, or creed, then I will be there to do battle. But I would not expect you to understand.

And you don't need to understand if we confine our discussions in this forum to scanners and scanning.

> Because this is your life, this who you are.

You don't have a clue as to who I am Katz. Not a shred.

> You are "x" and as long as you are, you will take everything anyone
> says as a personal attack and defend until the end.

I don't "take", Katz. If it is an attack, I may choose to deal with it. If I do....then yeah, it will probably be to the end. My Life

defintely has a few commitments. I love commitments. I thrive on setting goals and then reaching them. And what's a little pain?

>>It is not an issue of perfection. It is an issue that YOU are not >>qualified or capable of leaving so much as a bird track in my shadow.

> If you feel I am "Qualified" or not, I do not have to meet with >what "YOU" feel is your level of qualifications to respond.

You don't 'have' to do anything, Katz. But you don't have a choice of being "qualified". You are not. And yet, you can still PLAY like you are. You are free to act whatever role suits your fancy. You have already laid the foundation for being an actor in the opening of your post. You said you "work as.....". That is an act.....a pretense.

> This is an open forum.

Whew! So far, anyway.......

> You are not some Newgroup God, or No-it-all.

Nope, I ain't any of those.

> In fact you may learn something form others.

I do. But not from you. Well, nothing about scanners and scanning, anyway. In that world, you are an apprentice, if that.

> If others want to respond with flames such as you do then flames >might very well be what they get in return. Because you ARE your work >you take everything as a flame and then flame in response. This is >what causes your Wars.

Not only do you work "as a news cameraman", but also as a shrink, I see. No wonder you are not very good at anything. To be real good at something, you have to focus....to concentrate.

>>It might well be that I couldn't stand in your shadow as a news >>cameraman, too, but the thing is, I do not run over to >>REC.NEWS.CAMERAS and challenge everything you know in that field.

> Bill if you don't want anyone to challenge anything you say, then >don't post anything.

I would expect challenges if I were to announce that Buddhism was the ONLY way to eternal life in the here-ever-after.

To get a challenge from the likes of you on a simple issue of the best tool for a radio job after I studied and developed the procedure over a period of years.....is.....well, ridiculous. Yet, you are free to challenge. But it's stupid and detractive from the whole idea of this forum.

This is not an electronic technology classroom where everything is clear-cut and dried and where only one answer is right on the Pop

Quiz. This is an extension of real life, Katz. Hundreds of people out there may have a need to tweak their X-301's in the PRO-2004/5/6 scanners. I developed and articulated a precise methodology where a couch potato could succeed.

The few techs and engineers out there MIGHT well have the "correct" alignment tool, and if they do, they would also have the wherewithal to use it. The vast majority won't have the "correct" tool, however, so I found and tested a PERFECTLY ACCEPTABLE alternative....one that results in a very ACCURATE X-301 with no damage. I can't predict what an imbecile would do, but rest assurred that THIS is not the first place I posted that process.

I published it some time ago after a serious beta test and evaluating LOTS of input from people all over the world. No one to this day has screwed up their X-301 of whom I am aware. Hundreds of successes have been reported.

Katz, I blended into my article a 25-yr knowledge of human tendencies. I KNOW people won't run out and spend a half a week looking for the precisely correct alignment tool....if there is such a thing. So I found one that is as correct as correct can be in terms of the results, the goals, the objectives of the project.

It would have been an entirely DIFFERENT matter had you responded with a suggestion for what you believed to be a better tool. You didn't.

Neither did you "challenge".

You attacked.

Your response and subsequent ones were very, very foolish.

Billy "butt-cheeks" eats dog shit. He prefers to stick his head right at the dog's ass and catch the shit in his mouth as it squirts out of the dog's asshole. After the dog is done shitting, he licks its asshole clean. If there are no dogs around, he just picks turds up off the ground and eats them. I heard that he sits and listens to his scanner while his dog licks his little shriveled up dick. Sometimes he 69's his dog and licks his butt for dingleberries. Bill cheek= loser extraordinaire!

: So Daniel, give us some more clues, what is the desired
: application/modes/Rx type/data rates......

My main interest right now is in the data tones used by local emergency services, with secondary interests in FAX/RTTY/CW/etc.

Actually what's happening on the air and in the radio aren't so important, the issue that I'm looking at is...

given an audio output from a (A)FSK signal - ie. an audio tone of changing frequency - what is the best way to demodulate that waveform into frequency-versus-time and then into binary data?

I know about the zero-crossing method, and I can apply that in software. Are there any better methods?

The data rate won't be high. Our ambulance service puts FSK data over their voice channel - I believe it's pager traffic, so I'd imagine data rates of 600 or 1200 baud, 2400 at the outside.

I reckon I have it mostly figured out, the next question is how to work out where the bit boundaries are. ;-)

Daniel.

Dr Pepper (cheshire@ridgecrest.ca.us) wrote:

: I'm curious, Daniel, , , , Why are you trying to reinvent the wheel?

Because I need a square wheel, and everyone else's is round! :-)

Yes, I'm aware of the data slicer circuit, the Universal M400/M1200/etc
and all those other decoders.

What I want to do is multi-channel demodulation/decoding of digital
signals. I want to monitor/analyse/record certain things, like the
tones our fire and ambulance services use, and I'd also like to demodulate
RTTY/FAX/CW (as a secondary interest).

There are two reasons why the various kits and off-the-shelf products are
no use to me. First, they all need one PC per channel (as they invariably
use DOS software). Secondly, I want to do some realtime analysis and have
actions taken (eg. paging me) when certain things occur.

And there's always the cost factor. ;-)

I've set up a fast PC running Linux with (initially) one soundcard. That
system digitises the audio output from the radio (scanner). That's all
working. Once I have done the demodulation step, its then simple to write
software to decode the demodulated data into whatever type of traffic I'm
listening to.

It's not a particularly hard thing to do, I have a fair idea how to do
the demod - I only asked because I knew other people have done this with
a soundcard before and I wanted to know if someone knew a better way.

For the record, at this stage it appears that the "zero crossings" method
(ie. basically a software implementation of the data slicer) is the best
way to go.

Daniel.

I'm curious, I work as a police dispatcher. What do you folks like the most of your hobby, what do we dispatchers do that frustrates you. Most times a call of consequence comes in, we dispatch it digitally so that the TV trucks don't beat the police to the scene. Is that one of them. How do you feel about MDT's? Just curious. I only use my scanner to listen to the channels just prior to going into work. Then I know where I might want to work based on the dispatcher I have to relieve.

Some are worse than others. Some dispatchers leave channels in choas, and frequently you can sit down and feel the hate coming from the street. I can usually calm it down in a few minutes, but its extra work I can do without. Plus some are very good about writing down officer safety info, and its well organized, while others don't bother to write anything down period. But then job burnout is pretty common in this job.

> to write anything down period. But then job burnout is pretty common
> in this job.

Yea, I had a friend who dispatched for the city and he quit after 2
years.
I listen alot to the police and around here the dispatchers take care of
the police.
You can really hear the concern in the dispatchers voice. A county cop
got shot about 5 years ago (he is alive) and ever since then they have
been on top of things.

Personally I have no idea why anyone would want to dispatch for!
My friend said that he would be by himself 90% of the time dispatching
15 police officers answering Ten 911 lines and Three local lines. He
said sometimes he didn't know how he did it but told me it wasn't that
hectic all the time. He said he loved 2am to 6am cause it was quiet most
of the time. He was only paid $6.50 an hour plus benifits.

So could you. I am tired of reading these attacks on another. My sense of ethics forbids me to do the same to you in the same manner, but I can give you some usefu; advice. If you have a problem with the man, take it up in e-mail. A lot of use are tired of your tirade and don't want to hear about it!

>That's correct it was a public post and I had something to add,
>including my flames. You could have filtered it out if you wanted to.
>Instead you keep it going. Your as guilty as anyone else here.
So, dear friend, are you. Pointing out everyone elses faults makes yours stand out like the proverbial sore thumb. In fact, the more you pursue this, the more you look the fool for even trying. Point is, concentrate on your own problems and let us get back to scanner. PLEASE?

>So you find them immature, welcome to the club. Seems like a lot of
>the material found here is immature. Take Bills for example.
Why don't you read your own posts and say that? be carefule about pointing fingers, Ron. invariably, the 1 pointing at another stands out more then the 4 pointing back at you.

>I don't give a shit if your bed bound, its has nothing to do with the
>topic and you will get no pitty from me. Your a person like anyone
,SNIP>
Your right, it has nothing to do with the topic here. So, get back on topic! If you can't talk scanners, go to ALT.REC.RADIO.SCANNERS.FLAME_FEST and flame there.

>You can request until your blue in the face. (please don't tell me
>you were also painted with blue ink)
why? are you? do you have a gallon bucket of blue paint just waiting to paint someone?

>I had legitimate technical input. Maybe I should have posted my flame
>as a different message but if your really cared you could have
Yes, you should have. However, its too late now and your message has not been taken very seriously. In fact, if you had posted only the technical point to be made, tou would have been left alone on this point. BUT NO! YOU HAD TO FLAME. CHANGE YOUR DIAPER RON. I am tired of having to deal with the crap.

>Anyone else want to call themselves a VICTIM?
Yes, you. You scream like one, you act like one. So, you must be one.

Lets not carry it any further. I think others would agree with me and have this whole matter dropped. However, if you want to make a bigger fool of yourself, go right ahaead. I won't stop you.

Eric.

I actually read an article in Newsweek that this type of thing is true and legitimate! I figure it's worth a try!

M. Hache wrote:

Everyone seems to be making money on the net these days. If you are reading this I assume that you have decided that it's your turn. The opportunity that will be described here is a PROVEN MONEY MAKER and it's perfectly LEGITIMATE AND LEGAL. So if you are ready to make some money read on, you have everything to gain..... Save this article to a file on your hard drive because you will need it later.

I came accross this opportunity in one of the news groups. I read the article that was posted (very similar to this one) and thought that it sounded too easy. There had to be a catch. I checked with a friend of mine who happens to be an attorney and she assured me that it was

perfectly legal with no catch as long as I followed the rules which are spelled out below.

It will cost you five dollars to try this out but believe me you will make it back 100 fold. Just for the sake of saying it, you will not be sending the five dollars to me. Honesty is a must for this to work so follow the rules to the letter and in a few weeks you will be amazed at the results. I sure was.

These are the rules:

1) Take five sheets of paper and write the following on each one: 'Please add my name to your list' include your name or the name of your business and your mailing address. In this way you are asking the person who receives the sheet of paper to perform a service for you which will be explained as we go through the rules.

2) Now take each sheet that you prepared above and fold it around a one dollar bill (Please use U.S. currancy). Do not send checks or money orders. In this way you are paying for the service you have asked them to perform from step one. By folding the paper around the dollar bill you will insure its arrival at the intended destination.

3) Take each of the requests for service along with the one dollar payment for the service, place them in five envelopes, and send them to the five people listed below.

4) Read this step carefully. Remove the first name from the list of five names below. The name in position 1. Move the other four names up one position so that the name in position 2 is now in position 1, the name in position 3 is now in position 2, and so on. Place your name and address in position 5 (the last position on the list). When doing this do not use a word processor. You must leave this article as a straight MS-DOS text file so anyone recieving it can read it.

5) Now upload the updated file with your name in position 5 to as many news groups, and bulliten board message areas as possible. Give it a catchy description like "NEED CASH....FAST ??" or "PAY OFF YOUR DEBTS IN 90 DAYS", or "NEED CASH FOR THE HOLIDAYS ??", etc. The more uploads you make the more money you will earn.

6) This is another VERY IMPORTANT STEP. When someone sends you a dollar requesting that you add thier name to your list you must perform the service requested. All you need to do is save all the sheets of paper requesting to be added to your list in a folder (your list).

7) What do you do with your list? As time allows take the names and add them to the list below 2 or 3 at a time to the bottom most positions like 3, 4, and 5. Put yourself in position 2 or 3 and upload that article. In that way we all multiply the number of times our name appears and we perform a legitimate service. Be sure to continue to

post the original updated article as well with the names as they
appear below and your name in position 5.

If you need help uploading just ask someone in one of the news groups or
the sysop of the bullitin board and they will explain how it's done.

You can expect to see a little money start to trickle in at around 2
weeks, but around weeks 3 and 4 WOW!!

8) When the 'money storm' hits your mailbox go pay off your bills and
debts, and then go get that something special that you've always
wanted, or for your love ones.

HERE IS THE LIST OF NAMES:
Position 1: Amir
8 Hanurit Street
P.O.Box 154
Kochav-Yair 44864
Israel

Position 2: Richard Fitzgibbons
913 Maple Lane
Lebanon, PA 17046
U.S.A.

Position 3: G. S. Interprises
P.O. Box 570
Fairmont, MN 56031
U.S.A.

Position 4: Michael 001
11-9, Ross Ade Dr.
West Lafayette, IN 47906
U.S.A.

Position 5: M. Hache
P.O. Box 364
Shippagan, N.B.
Canada
E0B-2P0

HONESTY is what makes this work so do send the request for service and
the one dollar payment for that service to the five people on the list.
I invested the five dollars and it payed off big time because now the
five people I sent to are all helping me get this posted with my name
on their lists. If we all play fair the results will speak for themselves.

Set some kind of a goal like 15 or 20 posts or more every couple of days.
Make sure it's a goal you can achieve. One last thought, keep track of
how much you make because you will need to report it as income for tax
purposes.

Just for fun you might also include on the sheets of paper the position
that person was in when you got this article,

You might want to keep this letter in a secure place, so that you can use
it
again sometime in the future.
Sit back and start enjoying your life. Life is short, play hard!!!

> Ron: Is EVERYONE who disagrees with you an "idiot"?

No not Everyone, Just the ones who say "your wrong" call some name and
run without supporting their argument. You know, the guys who just
wants to add to the flame, to jump into the fun.

> I don't believe
>that I have ever seen a comment from you where you are not calling
>someone names or insulting them in some manner.

Maybe you should have a better look then.

I'm willing to prove you wrong. I do have the last few years of
material that I have posted here saved in a folder.

If your so sure why not give me a list of what you have seen that you
consider to be name calling or insulting I'll do a global search and
eliminate that. Then I can email you the rest of my posts. You can
then be a better judge.

If what you say is true then you should receive nothing.

If you don't have a clue what your talking about then you may receive
a few bytes or a few megabytes.

Just say the word.

>Do you drink a lot before signing on the net?
>

Another great example if the Idiots I'm talking about.

Like I said before.

Carlos Tomasio (ctom@napo.electrodata.com.pe) wrote:
: Help, I need information to equipment for Monitoring Individual Cellular
: Calls

Listening to random individuals talking on cellphones for entertainment purposes is quite easy with a scanner. However, if you are singling out a particular person to monitor, the equipment to do this costs more than $10,000US. Laws vary in countries, but in most cases using equipment which can monitor cellular is subject to legal restrictions, it often is not sold except to people legally authorized to intercept such calls.

5217. Philly Freq Guide

Newsgroup: rec.radio.scanner
Date: 1996-09-18 00:00:00 UTC
From: Josh Heller <jheller@enter.net>
Message-ID: <01bba508$16334200$4946aacc@jheller.enter.net>

The new 3rd edition of the Philadelphia Area Frequency Guide, PAFG for short,is out! It you have never seen it, it is great. Not only do you get complete frequency lists for all major services (minor ones too!) you get Police, Fire and EMS Squad Numbers, Unit ID #'s, Fire Company #'s for every county in the book! How about them apples! VERY DETAILED!

The book is written by Lou Campagna, a longtime Philly area monitor who has written (and still does) for many top scanner magazines.

The book is available from Starion Electronics for $16.95 +$2.25 shipping & handling. ($19.20 total)
PA residents must add 6% sales tax on the $16.95 book. This is an additional $1.02. PA Residents total is $20.22.

PAFG - Internet Offer
Starion Electronics
422 Town Center Suite 222
New Britain, PA 18901

This will be the best and most informative book you can buy about this area!! Here are the covered counties.

Berks, PA
Chester, PA
Delaware,PA
Bucks, PA
Montgomery, PA
Philadelphia, PA
Gloucester, NJ
Burlington, NJ
Camden, NJ
New Castle, DE

..more info available at http://www.enter.net/~jheller/scanclub.html

No Bill I am not "A" news cameraman, I "WORK" as a news cameraman.

I don't live my job, you do. Look at the difference.

>I am an engineer across a variety of disciplines, including radio and
>telecommunications. I do not pretend to tell you how to hold, focus,
>and zoom your camera.

engineer or Engineer? Is it a title (as in a noun) or an adjective?

Either way, does it mean you know what your talking about, or that you
know more about Radio Electronics then anyone else? No. Most of all
it does not mean that yours is the last say. Its means NOTHING here.

>
>You have made a sustained practice of attacking the sum and substance
>of my 33+ years in the radio communications academia and field .
>
Bill, when you attack people attack back, read on....

Most people would say they work as a "x" your say you are an "x"
Because you ARE your job, anything said contrary to your "views" are
taken as a personal attack. An attack against you, instead of your
reasoning. When you feel this happens you attack back then the fights
start. Eventually the discussion changes from the original subject to
nothing but a flaming war. Then you turn it into. Billy "The Victim"

You have to learn how to separate the two. If you can't then your
wars will never end. Your History speaks for itself. Note, The
Wars here and on other forums have always been "Bill Cheek vs.
Someone" all these little fights others have here, including with me,
all started with fights involving YOU. You also take great pleasure

sitting back and laugh at how your fights spring off into different directions. The <Grin><Giggle> comments, etc. are a perfect example. This becomes a form of entertainment for you.

Understand Bill, many will eventually stop the fights with you. Including me. The little offspring fights that started with you will also end. But, your fight will always go on. Because this is your life, this who you are. You are "x" and as long as you are, you will take everything anyone says as a personal attack and defend until the end.

>
>It is not an issue of perfection. It is an issue that YOU are not
>qualified or capable of leaving so much as a bird track in my shadow.
>
If you feel I am "Qualified" or not, I do not have to meet with what "YOU" feel is your level of qualifications to respond. This is an open forum. You are not some Newgroup God, or No-it-all. In fact you may learn something form others.

If others want to respond with flames such as you do then flames might very well be what they get in return. Because you ARE your work you take everything as a flame and then flame in response. This is what causes your Wars.

>It might well be that I couldn't stand in your shadow as a news
>cameraman, too, but the thing is, I do not run over to
>REC.NEWS.CAMERAS and challenge everything you know in that field.
>

Bill if you don't want anyone to challenge anything you say, then don't post anything.

If you do not want anyone to question or challenge you then become a God. I don't think this is possible, but you can always form a Cult. You can even have your followers. I know your close to that already I've seen how some have tired to defend you here. You know, they can't think for themselves, they use your comments as a defense, and have nothing to add of their own except their brainwashed idea that your always right.

>Big differences there, Katz. Lots of them.
>
You got that right.

I just had a phone call today (9/17) from Washington State Rep. Brian Thomas who spoke with State Patrol Capt. Tim Ericsson (just guessing on spelling) regarding the State Patrol's proposal to regulate all radios in vehicles and requiring certification of all mobile radios by the state Patrol.

As a result of many letters received, the State Patrol is cancelling the Oct 9th hearing and will go back to the drawing board. The purpose of the rule was intended to be confined to mobile cellular telephone installations. They received a lot of feedback and realize that their proposal was wrong and needs to be thought through and redrafted in a more appropriate manner.

From: markl9@aol.com
Message-ID: <51o5kt$93j@newsbf02.news.aol.com>
Source record: 222957

Does anyone know the frequencies used by the following ambulance companies in the Orange County, CA area?

MedTrans
Medix
Doctors
and any others I might have left out

Sure, Police Call and MetroScan have some frequencies listed, but some are old and no longer used and I'd like to be sure about who's on what frequency.

In the Los Angeles area, does anyone have the frequency for MAURAN Ambulance? MetroScan has them at 155.175, but they haven't been there in YEARS. Police Call had them listed at 460.100, but I haven't heard them there in a long time, either. Someone I know said they're on 806 MHz, but I don't here anything there. Help?

-Bill Cheek-

Build the following simple circuit left of Points A and B on a piece
of perfboard. The circuit to the right of A and B is optional,
explained further below.

|<-----Build on perfboard----->| |<--Project Box-->|
in scanner o-------|
Connect Jack Plug | |
to Y .01-uF 1N34A A C v |
Cathode>----||-----o--->|------o-----o----> (+) >--o-/\/\/\----o
detector | | | 5-k | <+>
diode --- --- \ Trimpot CB
in 1N34A ^ --- / 68-k type
scanner | .01-uF | \ OPTIONAL S-Meter
| | | | <->
Ground >-----------o-----------o-----o----> (-) >--------------o
Z B D
|<---keep leads short--->||<----Any length leads ok---->|

Diodes must be germanium, 1N34A or 1N60. Capacitors should be
ceramic disks. Resistor and trimpot are not critical. The circuit to
the left of Points A and B must be as shown. If you want to use an
external CB-type S-meter, so much the better....just build the meter
of choice into an attractive or functional project box with a cable
of any length from the box to Points C and D which should be wired to
a male RCA plug.

Connect Point Y to the cathode of:

PRO-2006: D-33
PRO-2005: D-33
```

PRO-2004: D-31
PRO-2022: D-29
PRO-2035: D-34
PRO-2045: D-34
PRO-43: D-302
PRO-39: D-202
PRO-34: D-117
PRO-37: D-122
Other Scanners: This mod may work with other scanners that have the civilian aero band of 108-136 MHz. If your scanner has 108-138 MHz and is not listed above, then find the last 455 kHz IF section, and locate the AM detector diode. Connect Point Y to the cathode of the AM detector diode.

NOTE: This mod may not work with Uniden scanners.

Keep this Point Y lead length very short, not more than an inch.

Connect Point Z to scanner PCB or chassis ground and keep that lead short, not more than 1 inch.

Points A and B are the metering points where any DC voltmeter can be used. Signal range will be about 0-1v. The circuit to the right of A and B is an optional CB type S-Meter, and should be used external to the scanner. Therefore, it is ideal to wire A and B (length not critical) to an RCA phono jack on the rear panel of the scanner for easy connection of the external meter.

Otherwise, any DC voltmeter can be used directly at A and B including a bargraph LED display. If the external S-meter circuit is desired, then wire it as shown. Use a walkie talkie or other transmitter to send a strong signal into the scanner, and adjust the 5-k trimpot so that the meter reads exactly full scale. All other signals will then read proportionally lower.

Most any analog CB-type S-Meter is ideal for this project, but the larger the face, the more readable it will be. There are thousands of junked CB rigs all over the planet, and most any CB or radio shop will have a bin full of them. The cost of a salvaged S-Meter should be negligible.

You can embelish your S-Meter with a small pilot lamp behind it to illuminate the face. Many CB meters have such a lamp built into the body of the meter. You may have to tap 12-volt or other power from the scanner for the lamp, or provide external power.

NOTE: I cannot and do not supply S-meters. I can and will provide technical support of this project on this forum or by e-mail.

This will likely fall apart badly in the presence of even trivial amounts
of noise. And if you managed to make it work, it probably wouldn't be
very simple either...

>Harder ways include writting digital bandpass filter code or transform
>code (Fast Fourier Transform is fun to play with!) which should
>perform better in the presence of interference.

What follows isn't likely to be optimal, but it is simple:

Rather than a full-blown FFT, you could simply do one slot centered
on the frequency Fmid = (f0+f1)/2 where f0 and f1 are the tone frequencies.

So you'll have two tables:

S is a sin(-2.0*M_PI*Fmid*Ts*i) for i=0 to N-1 samples
C is a cos(-2.0*M_PI*Fmid*Ts*i) for i=0 to N-1 samples

where Ts is your sample interval, and how N is chosen is left as an exercise.
Note that as indexes increase, you are going back in time (ie, to earlier
samples).

As each sample comes in, you add it to a table X of the last N values
taken. Compute s and c:

s = S.X, ie, S[0]*X[0] + S[1]*X[1] + ... S[N-1]*X[N-1]
c = C.X, (ditto)

ie, your basic FIR computation.

Then with s and c in hand, compute:

phase = atan2(s, c)

This quantity alone is not important. It is how it *changes* that is the key. For example, if f1 is being received, and is the higher frequency, then as successive values of 'phase' are computed, it will "increase" (the expected value is (f1 - Fmid)*Ts*2.0*M_PI radians per sample). If 'f0' is being received, then 'phase' will "decrease".

You probably get the idea: keep track of the last 'phase' computed, compare to the current. Call the difference dphase. Subject this to some weak smoothing -- a simple exponential filter will likely do -- and should the smoothed 'dphase' be above some value, you can decide you are receiving a "1", below some othe value a "0".

Actually, you'll likely want to use a better algorithm than that (indeed, if you are a FEC kind of guy, simply *don't* decide what the value is -- pass up the probability, a "soft decision" as it is called, to the FEC decoder to deal with). And I haven't addressed the issue of deciding where the data edges are -- what the cognescenti call "clock synchronization" -- but all this is what books are for.

5235. Looking for New Disney Freq's

Newsgroup: rec.radio.scanner
Date: 1996-09-18 00:00:00 UTC
From: Bob <wa2sqq@hili.com>
Message-ID: <51njei$3kc@news.ios.com>
Source record: 222964

I'm looking for any information on new freq's being used at Walt Disney World in Orlando. These will probably be in the 800 mhz band. I am updating my entire list and it will be posted in a week or two.

Bob

5236. Re: Ambulance Freqs?

markl9@aol.com (Mark L9) said:
> Someone I know said they're on 806 MHz, but I don't here anything there.

You won't hear anything on 806.000 MHz - it's simply a placeholder entry
in FCC license files. It indicates a subscriber to a commercial repeater/trunk
in the 851-866 MHz range, most likely an 861-866 SMR. The mobile licensee
would be 45 MHz lower, 806-821.

5237. Cleveland Hamfest

Newsgroup: rec.radio.scanner
Date: 1996-09-18 00:00:00 UTC
From: "Bill in Cleveland, Ohio" <thing@en.com>
Message-ID: <323FAC86.4C91@en.com>
Source record: 222966

The Cleveland (Ohio) Hamfest is Sunday, Sept. 22. It is at the the Cuyahoga County Fairgrounds in Berea. Easy access from I-71 at the Bagley Road exit; just go west one mile.

5238. PRO 2004 Mod's

Newsgroup: rec.radio.scanner
Date: 1996-09-19 00:00:00 UTC
From: baxtecr@wku.edu
Message-ID: <1996Sep19.104102@axp1>
Source record: 222567

I need information on the Pro-2004 unit. I know there are several mods for this particular scanner. Could someone pass them my way?

Thanks.
Chris Baxter

5239. Freqs. for SLC, Provo area?

Newsgroup: rec.radio.scanner

Try Radio Shack. If you have the latest catalog, look on page 43. You
will find exactly what you want there. If you don't have the catalog,
the is the description of the antenna right from the catalog.

(8) Mobile 'cellular look-alike' glass-mouint scanner antenna. No
holes to drill. Easily installs on windshield or window. Covers 25 to
1300 Mhz. 22"-high element. Includes 16-foot cable with BNC connector.
20-011.......29.99.

I did not author this, I found it on a web page and figured some of you might want to see it.
Bill

TSCM.COM - Counterintelligence and Counterterrorism WWW Page

Major "Real-World" Bugging Frequencies

Over the years I have had numerous TSCM and intelligence people ask for an outline of the RF spectrum used by bugging devices. Bugging devices can appear on any frequency between DC and light, this list covers the more common bugging frequencies that tend to be used.

The frequencies that follow are all based on hard documentation (catalogs, intel reports, technical materials, etc...). For the purpose of intelligence analysis the Source Reliability Scale should be considered A, and the Data Validity Scale should be rated as 1.

This list is updated every two or three weeks, please foward (via US Mail)any technical materials you would like to see reflected in the list.

Remember to check the entire RF spectrum, not just specific frequencies; however, keep in mind that people doing buggings like to stay clustered around certain frequencies.

Summary (this will catch 99.99% of all Non-Intell/Diplomatic RF bugs)

All TSCM Inspections should include the following frequencies:
(Expect to see less than .5-25 mw maximum at the TX antenna)
(Do not expect the signal to be present for more than 20uS-100uS)

To find RF transmitters a search grid of roughly 15 foot by 15 foot (the size of an average office) should be used.

All phone rooms, riser closets, demarcs, boots, etc. MUST be checked.

Remember that the microphone/camera can be hundreds of feet away from the transmitter.

Use a digital spectrum analyzer and a wideband receiver with an analog 10.7/21.4mhz SDU on the IF, dispersions of 100/200/500khz).

RF Spectrum Analysis and monitoring should take place for at least twelve solid hours during a regular sweep (72 hours or more is preferred).

To prepare for IPM the spectrum should be evaluated/monitored for at least four hours prior to the event.

Most non-gvt RF bugs will have a transmit frequency between 9khz
and 6ghz.

The Spectrum Analyzer inspection must cover at least 3khz to 40 ghz
VLF Detection-Audio .3 khz to 100 khz Video Cameras &Tape recorders
VLF Detection-RF 12 khz to 500 khz Video Cameras &Tape recorders
VLF Detection-Audio .3 khz to 150 khz Microphone/Ultrasonic Chirping

Carrier Current Bugs 3 khz to 50 mhz 99% Voice
Carrier Current Bugs 20 mhz to 300 mhz 99% Voice (AC Mains Antenna)

RF Bugs-HF 3 khz to 50 mhz 99% VoiceSpace
RF Bugs-VHF 30 mhz to 300 mhz 10% Video/80% Voice/10% Data Space RF
Bugs-UHF 300 mhz to 900 mhz 25% Video/60% Voice/15% Data

RF Bugs-Microwave1 900 mhz to 3.0 ghz 70% Video/20% Voice/10% Data
RF Bugs-Microwave2 3 ghz to 18.5 ghz 75% Video/15% Voice/10% Data
RF Bugs-Microwave3 18.5 ghz to 40.0 ghz 75% Video/ 5% Voice/20% Data

...and of Course Infrared! (Look for "IR Blooms")

700 - 1100nm Audio Transmitters/Lasers (CF between 880 and 950nm)
750 - 900nm Night Vision Illuminators
900 - 1710nm IR Video Illuminators

Note:
Most military/intelligence and governmental TSCM inspections look for
devices between 3khz to 220/300mhz for Carrier Current, 20khz to 40ghz for
regular free space RF radio devices, and directional microwave devices
from .3ghz to 110/120ghz.

Common Wireless Bugs (Low Power - Well under 35-50 mw)

44.500 - 51.000 mhz "Baby/Room" monitors
72.100 - 75.400 mhz Hearing Assistance systems
54.000 - 150.000 mhz "Kit" Bugs

98.000 - 108.000 mhz Cheap out-of-band FM Bugs
112.000 - 142.000 mhz Cheap out-of-band FM Bugs
140.000 - 160.000 mhz Cheap out-of-band FM Bugs

60.000 - 320.000 mhz Low Cost kit bugs
398.000 - 406.000 mhz DECO Bugs(398.600/605, 399.450/455,399.025/030,
406mhz)
25.000 - 450.000 mhz European/English Kit Bugs

150.000 - 216.000 mhz Typical VHF "Body Wire" & Pro-Grade Bugs
109.000 - 140.000 mhz Digital VHF Pro-Grade Bugs
138.000 - 174.000 mhz Typical "Spy Shop" & LE Cheap VHF Bugs
(155-172 Popular)
140.000 - 150.000 mhz Popular Xandi Flea power kits
(143/144mhz)
150.000 - 170.000 mhz Popular Japanese Flea power kits (under 5mw)

150.000 - 220.000 mhz Commercial Wireless Microphones
169.000 - 172.000 mhz 47 CFR 90.265 Authorization *** VERY
Popular ***
174.000 - 216.000 mhz 47 CFR 2.106 (NG115) Authorization
395.000 - 410.000 mhz German UHF Wireless Microphones (PK Electronics)
219.000 - 530.000 mhz English UHF Wireless Microphones (300-500 popular)
470.000 - 608.000 mhz Commercial Wireless Microphones
730.000 - 806.000 mhz Commercial Wireless Microphones

889.000 - 960.000 mhz Modified Cordless Phones (S/S & Hoppers)

380.000 - 480.000 mhz Video Bugs - US
890.000 - 960.000 mhz Video Bugs - US (902-928 Hot)
905.000 - 928.000 mhz Video/Audio Consumer Products (i.e.: Recoton)

1.700 - 1.930 ghz Video Bugs - US
2.400 - 2.500 ghz Video Bugs - US *** VERY Popular ***
5.725 - 5.850 ghz Video Bugs - US *** VERY Popular ***

1.100 - 1.400 ghz PAL Video Bugs*Very Hot in England/France/etc*
2.400 - 2.500 ghz PAL Video Bugs *Very Hot in England/France/etc*
3.500 - 4.500 ghz PAL Video Bugs *Very Hot in England/France/etc*

430 - 550 mhz Popular French Video/Audio Bugging System
950 - 2500 mhz Popular French Video/Audio Bugging System
700 - 900 mhz Popular Italian Audio Bugging System

"Tactical" Bugs

225 - 400 mhz "Throw away" bugs (10uw-300mw Beer can bugs)
290 - 330 mhz Micro-powered Bugs (5uw-10mw Cigarette Butt Bugs)

30 - 500 mhz Tactical Repeaters (75mw-300mw)
285 - 400 mhz Tactical Repeaters (50mw-10watts)
100 - 152 mhz VHF Tactical Repeaters (300mw-25watts)
135 - 174 mhz VHF Tactical Repeaters (300mw-25watts)

VLF and Carrier Current Type Bugs

9khz - 490 khz Carrier Current 47 CFR 15.219 Auth (250 mv max.)
490khz - 1.705 mhz Lossy Cable 47 CFR 15.221 Auth (1000 mv max.)
450khz - 30.00 mhz PLA Systems 47 CFR 15.207 Auth (30 mv@ft/30ft max.)

3 - 200 khz 300 mw High Grade Pro Bugs (over 500$ each)
100 - 200 khz 50-100 mw Older Bugs
120 - 200 khz 30-50 mw Pre 1990 intercoms
200 - 300 khz 30-50 mw Post 1990 intercoms
300 - 400 khz 250-400 mw TELCO Line transmitters (355khz popular)

300hz - 30 khz Cable TV Carrier - Hardwired microphones
30khz -300 khz Cable TV Carrier - Coaxial Bugs

100 - 450 khz Threat Window #1 Most CC Bugs
3khz - 3 mhz Threat Window #2 Expensive "Pro-Grade" Bugs
5khz - 32 mhz Threat Window #3 Popular WJ Carrier Current Rcvr

3khz - 50 mhz Threat Window #4 Realistic Threat Window for Telephone
Wire
15mhz - 70 mhz Threat Window #5 Audio/Video "Micro-Wire" RF circuits

WECO Bugs "boosted/ultrasonic audio" found on Power/CATV/Telco lines

64kbps to 1.5mbps Digital Bugs T-Carrier-Lo (T-1 and Below)
1.5mbps to 50mbps Digital Bugs T-Carrier-Hi (T-1 and above)
2.048mbps Digital Bugs Definity Circuit Pack Bug
32mbps Digital Bugs TMS Channel/Backplane bridge
Designed to transmit on CC or Microwave ISM Spread Spectrum (2.4-6.0ghz)

VLF Devices

25khz - 90khz Tape Recorder Bias Osc-Low End (35-45khz Common)
80khz - 145khz Tape Recorder Bias Osc-Mid Range (88.2, 96, 100khz
Common)
100khz - 325khz Tape Recorder Bias Osc-Pro Grade (100, 150, 300khz
Common)
40khz - 50khz Tape Recorder DAT/Hi8 (44.1/48khz Common)

8khz - 35khz Recorder Audio Servo Noise (10-20khz Common)

7khz - 35khz Video Camera VLF Detectable emmisions
15.750 mhz Common NTSC Video Camera
15.734 mhz CCD/PCB Video Camera (very easy to detect)
15.625 mhz Common Video Camera

Also, be aware of ultrasonic/audio emmisions from most VLF devices.
(Utilize a EOD/Bomb Tech Stethoscope, and Ultrasonic Spectrum Analyser)

Commonly Used Law Enforcement Bugging Frequencies

37.000 - 952 mhz FCC Surveillance Blanket Authorization

47 CFR 90.19 "Physical surveillance, stakeouts, raids..."
Straight AM/FM, FM-Subcarrier, SSB, Spread Spectrum, and Hoppers.
If encrypted, it usually uses in-band voice inversion or DES.
(Normally well under 2 watts... most under 35-150mw)

148 - 174 mhz
135 - 250 mhz Out-band Wireless Microphone
174 - 216 mhz In-band Wireless Microphone
350 - 440 mhz Common Video Freqs
380 - 930 mhz Wide Band Hoppers
806 - 824 mhz
851 - 869 mhz
905 - 930 mhz Popular Audio/Video Band

1.4 - 1.5 ghz Common Video Freqs
1.7 - 1.9 ghz Common Video Freqs (1.710 - 1.755 REAL Popular at 1/10
watt)
2.4 - 2.5 ghz Common Video Freqs (2.400 - 2.450 REAL Popular)
5.7 - 5.9 ghz Common Video Freqs (5.725 - 5.850 REAL Popular)

8.5 - 10.8 ghz Common Video Freqs

AID - Westinghouse/Audio Intelligence Devices, Inc. Bug Freqs
150 mhz - 174 mhz Standard/Primary Band (Most Popular)
135 mhz - 150 mhz Special Order/Secondary Band
216 mhz - 220 mhz Special Order
400 mhz - 470 mhz UHF Repeaters

36 mhz - 39 mhz Very Low Power WFM (.5mw - 50mw) ***Very dangerous***
80 khz - 200 khz "Line Carrier" Microphone Systems ***Very Dangerous***

1700mhz - 1900mhz 25-250mw Video and audio bugs (Mostly DEA/DOJ stuff)
2450mhz - 2484mhz 25-250mw Video and audio bugs

If the signal is "scrambled" it is nothing more than simple voice inversion,a circuit to "de-scramble" costs around $20.

Note: AID devices are often re-tuned for outband channels..so be careful.

The area of spectrum from 35mhz to 500mhz is the primary threat, 500mhz to 3ghz is the secondary threat, a "line carrier" threat is from 30khz to 750khz.

If the person planting the bug suspects that a TSCM may be conducted then AID suggests a frequency between 30mhz to 50mhz, sensitivity of rcvr should be better than .18uv/-122dbm.

Also, keep in mind that AID devices are frequently used for illegal buggings, so be familiar with what their realistic specs are, expect power outputs under 50mw, and expect to see the AC power circuits being used as the antennae.

Security Research Bugs
145 mhz - 175 mhz FAST-II-L Computer Bug - 1, 3, 10, 30, 100mw
170 mhz - 204 mhz FAST-II-H Computer Bug - 1, 3, 10, 30, 100mw

60 khz - 200 khz "Line Carrier" Microphone Systems ***Very Dangerous***

1.1 ghz - 1.4 ghz 250mw Lynx Video/Audio Bugs (L-Band)
2.5 ghz - 2.6 ghz 250mw Lynx Video/Audio Bugs
3.8 ghz - 4.2 ghz 250mw Lynx Video/Audio Bugs

Note1: LYNX video bugs and cameras are frequently built into old bricks, wooden joists, logs, gate posts and such... VERY, VERY Dangerous and easily concealed.

Note2: Most Security Research Bugs utilize fixed frequency inversion to protect against detection, the most commonly used frequency is a 1.862khz inversion point.

173.075 - LOJACK Auto tracking system beacon (200ms burst every second)

Police Speed Enforcement Radar
10.450 - 10.600 ghz X-Band

11.488 - 11.628 ghz RD Detector
22.976 - 23.256 ghz RD Detector-2nd Harmonic
24.050 - 24.250 ghz X-Band
33.400 - 36.000 ghz Ka-Band
700nm - 1100nm Laser Threat

Electronic Article Suveillance/Anti-Shoplifting Systems
8.10mhz - 9.30mhz Checkpoint (Hi-Q Tags) 8.2mhz Common
57.75khz - 58.75khz Sensormatic (Magnetic) Books, CDs, and Tapes
915mhz and 1830mhz Knogo (Microwave Resonant) Adhesive Labels

25 - 50 mhz "Bumper Beepers" (38 - 47 mhz very popular)
135 - 170 mhz "Bumper Beepers" (150-170 mhz very popular)
450 - 512 mhz "Bumper Beepers"
903 - 904 mhz "Bumper Beepers"
904 - 912 mhz "Bumper Beepers"
918 - 926 mhz "Bumper Beepers"
926 - 927 mhz "Bumper Beepers"

WARNING:
The area between 900 mhz and 6 ghz is EXTREMELY DANGEROUS as
the eavesdropping equipment in that range is inexpensive, low
power, and highly directional.

Additionally, most TSCM people will not check frequencies above
1.0/1.5 ghz or 3 ghz (because the equipment is too expensive for them to
buy).

I have seen surveillance video tapes of TSCM inspections where the
video cameras (Watec), microphones (Sony), and microwave RF transmitters
(AID -2.4ghz) were never detected by the inspectors (using 1ghz AVCOM
Spectrum Analyzers).

Surveillance Satellite (TK-Keyhole) Frequencies
Note: Mostly Wideband Spread Spectrum/LPI channels

420mhz - 450mhz
1.2ghz - 1.4ghz
1.7ghz - 1.9ghz (1.76-1.84 real active)
1.9ghz - 2.2ghz (2.115 real active)
4.9ghz - 5.0ghz
7.5ghz - 8.3ghz
10.6ghz - 12.6ghz (11.7-12.2 active)
17.8ghz - 21.2ghz (SIGINT Birds)
23.6ghz - 24.0ghz
25.5ghz - 25.7ghz
22.8ghz - 33.5ghz (30-31ghz SIGINT Birds)
42.5ghz - 47.0ghz
50.3ghz - 52.4ghz
78.0ghz - 85.5ghz
86.3ghz - 98.3ghz (86-92 real active)

Note: Can be anywhere between 20ghz and 110ghz, mostly spread
spectrum

Commonly Used by Federal Agencies for Bugs, Wireless Microphones,
and Body Wires (also 138-220 mhz, and 399-420 mhz, under 25-50 mw).

960-1215mhz Spread Spectrum Systems (Wideband)

Generally Recognized Federal Bug/Spy Bands
Primary - 25-50mhz, 135-175mhz, 225-440mhz, 1710-1950mhz, 8.3-12.5ghz

Secondary - 890mhz-5.50ghz, 7.0-9.5ghz, 10-39.6ghz

Also, Wide Band Frequency Hopping centered on various UHF-TV channels
(ie: 510 or 670 mhz with a hopping width of +/- 25 mhz)

Keep in mind that the federal government can use virtually any
frequency between DC and light.

Spread Spectrum/Hopping Bugging Frequencies

Legit Industrial Equipment (very inexpensive)
902 mhz - 928 mhz ISM band A (Very Popular)
2400 mhz - 2484 mhz ISM band B (Very Popular)
5725 mhz - 5850 mhz ISM band C
10500 mhz - 10550 mhz ISM band D
24075 mhz - 24250 mhz ISM band E

SS Amateur Radio Bands Often used for eavesdropping (very inexpensive)
50 mhz - 54 mhz 6.00m Amateur Radio Equipment (STA)
144 mhz - 148 mhz 2.00m Amateur Radio Equipment (STA)
222 mhz - 225 mhz 1.25m Amateur Radio Equipment (STA)
420 mhz - 450 mhz 70cm Amateur Radio Equipment (47 USC
97.305)
902 mhz - 928 mhz 33cm Amateur Radio Equipment (47 USC
97.305)
1240 mhz - 1300 mhz 23cm Amateur Radio Equipment (47 USC
97.305)
2300 mhz - 2450 mhz 13cm Amateur Radio Equipment (47 USC
97.305)

97.305)
5650 mhz - 5925 mhz 5cm Amateur Radio Equipment (47 USC
97.305)

SS Amateur Radio Bands Occasionally used for eavesdropping
10.00 ghz - 10.50 ghz 3.0cm Amateur Radio Equipment (47 USC
97.305)
24.00 ghz - 24.25 ghz 1.2cm Amateur Radio Equipment (47 USC
97.305)
47.00 ghz - 47.20 ghz 6.0mm Amateur Radio Equipment (47 USC
97.305)

SS Amateur Radio Bands Rarely used for eavesdropping (very expensive)
75.50 ghz - 81.00 ghz 4.0mm Amateur Radio Equipment (47 USC 97.305)
119.98 ghz - 120.02 ghz 2.5mm Amateur Radio Equipment (47 USC 97.305)
142.00 ghz - 149.00 ghz 2.0mm Amateur Radio Equipment (47 USC 97.305)
241.00 ghz - 250.00 ghz 1.0mm Amateur Radio Equipment (47 USC 97.305)
300.00 ghz - Light (3 Thz) Amateur Radio Equipment (47 USC 97.305)

Note: Most commmon spread spectrum/hopping bugging equipment will hop
at speeds between 100 and 50,000 hops per second. Equipment is readily
available that hops even faster (100,000 to 300,000 hops per second).
Dwell times can be as small as 1us (one widely used military system uses a

dwell time of 3-5us)

Outband Equipment
ANY Television broadcast or Cable TV frequency
ANY FM radio broadcast frequency
ANY Paging or Beeper frequency
ANY Cellular Telephone frequency

820 mhz - 960 mhz Modified (902-928) Cordless Telephones
Modified Amateur Radio Equipment (can be on ANY frequency)

Keep in mind that wideband (non-ISM) Spread Spectrum/Hopping Bugs are very difficult to detect(even if you are within a few feet). Watch for carrier feed-through, and "Noise Floor Humps".

All Spread Spectrum devices are detectable

Once Spread Spectrum/Hopping Bugs have been located (on the RF spectrum) all that can be done is to locate the sourse of the emission... it is virtually impossible to demodulate a SS signal unless you have access to the key.

Also, a 500mw ISM device can easily have an effective range of over 20 miles.

Look for spectral anomalies (humps) on the Spectrum Analyzer, and back up with a Compressive receiver.

Note: In the early 80's I spent considerable time working with diplomatic spread spectrum bugging devices operating on frequencies between 20ghz and 56 ghz, using a 3ghz window.

Band Width Resolution and Filters

Examine the spectrum with the following BW resolutions/filters:

Utilize all BW resolutions/filters between 5hz - 200mhz (depending on band being checked)

For frequencies between 9khz and 7ghz I generally prefer to start with a 3mhz IFBW for a "moving" sweep, and to monitor the (wideband spectragram). This makes the energy easy to spot, but tough to identify. The IFBW is then modified until it is roughly 85% of the signal bandwidth, the results are then sent through a vector analyser for identification.

All IFBWs available on the analyser are also cycled through and the results overlayed into a matrix, a little vector analysis is applied, and the channel parameters are easily extracted.

To handle the microwave bands IFBWs between 10khz and 200mhz should be used.

Real World Example:
Frequency Hopping bug, randomly hops between 630mhz and 700mhz, a

IFBW of 70mhz will allow the activity to be easily identified, but a
narrower IFBW will make it much more difficult.

Hint: A programmable digital spectrum analyzer should be used!
(1/3/5/10/15/20/25/30/50/75/100/150/200... Sequence is prefered)

BW Res - Usage/Primary Function
100/200 mhz - Resonate Cavity Bugging Devices/SIGINT Devices
125/35/8mhz - Resonate Cavity Bugging Devices/SIGINT Devices

50/20/10mhz - Diplomatic/Intelligence Microwave Bugs
40/20/10mhz - Diplomatic/Intelligence Microwave Bugs

13/16/20mhz - Microwave Wideband
11/12/13mhz - Microwave Wideband
.5/1/2/5mhz - Microwave Wideband (Burst Bugs)
18/26/36mhz - Satellite Wideband (Video)
2/4/6/8 mhz - Microwave Wideband (Video)
3/6/12 mhz - Microwave Wideband (Video) - Common
.5/1/3 mhz - Microwave Wideband (Video/Burst/Pulse)

1.5/.75 khz - Frequency Hopping Bugs - VERY Common
.4/.2/.1khz - Frequency Hopping Bugs - VERY Common
3.2/6.4 khz - Frequency Hopping Bugs - VERY Common
10/20/25khz - Frequency Hopping Bugs - VERY Common
50/75 khz - Frequency Hopping Bugs - VERY Common
100/250 khz - Frequency Hopping Bugs
300/500 khz - Frequency Hopping Bugs
1/2/4/8 mhz - Frequency Hopping Bugs

300/250 khz - Regular Wide Band Broadcast FM
150 khz - Narrowband Broadcast FM Audio, Television Audio
280 khz - Narrowband Broadcast FM Audio, Television Audio
200/150 khz - Commercial Wireless Microphone - High Grade
150/100 khz - Commercial Wireless Microphone - Concert/Broadcast Grade
58/77/84khz - Commercial Wireless Microphone - Typical Body Wire
50/60/75khz - Commercial Wireless Microphone - Typical police device
8/25/50 khz - European/Japanese Industrial Bugging Devices

50/30 khz - Wideband FM two-way communications (ie: Cellular Telephone)
16/15/6khz - Normal FM two-way communications
3/6/8/12khz - Narrowband Commercial - Voice
1/3.2/6khz - Narrowband (Marine, HF, etc...)

120/9/1 khz - Narrowband (Bias Osc./Video Cameras/SIGINT)

300/250 hz - Narrowband OOK/FSK/Data, etc...
300/250 hz - Narrowband OOK/FSK/Data, etc...

Subcarrier Detection:

10 - 500 khz - Most Commonly Used Subcarriers
30 - 150 khz - Typical Broadcast FM Subcarrier (FMSubC)
19/27/38 khz - Typical Stereo Broadcast FM Subcarrier (FMSubC)
67 khz - Typical Musicast/Musak Broadcast FM Subcarrier
(FMSubC)

2 - 10 mhz - Audio Subcarriers often used with Video (4.2-8 mhz common)

5khz - 950khz - Realistic Subcarrier Threat (Audio)
1mhz - 15 mhz - Realistic Subcarrier Threat (Video)

Final Note:
Beware of people in the TSCM industry who try to convince you that bugs don't operate above 1ghz or 3ghz, the folks who push this line are utter frauds, and are playing games with you.

Several "hole-in-the-wall" TSCM schools sell equipment (at highly inflated prices) and actively attempt to mislead students that all they have to do is spend $3000 to $5000 in equipment to enter the TSCM field.

Of course, these are the same crackpots who try to make you believe that they are the only electrical engineer, ex-CIA, ex FBI, etc... in the TSCM business.

I'm selling the following: (Prices Lowered 9/19/96)

AOR 2500 - was $400 obo -> now $375 obo -> now $350 obo

Or will trade for
AOR800 or PRO 2006 or PRO 43 or C508A or WS1000

Excellent condition.
This is a desktop/mobile unit
Full Cellular, AM/FM/NFM/SSB

OTHER STUFF:

ICOM 2GXAT 2m extended RX - $200 -> now $190.

Bearcat 560xlt 16 ch scanner - $60 -> might be sold .

E-mail any questions.

The reason you can buy and own one is due to the fact that the unit is generally broadbanded enough to be tuned to cover 10 meters where you can legally run more power thru a linear.

I once called Motorola to get some MRF454's to build a 160 Watt linear. I was basically grilled by the sales person asking questions like:

Are you a CBer?

Is the device for commercial or personal use?

Are you a licensed Amateur operator?

Do you hold a radiotelephone operators license?

Kind of sounds to me like they want to make sure that the parts are not sold for CB use. But they will sell them.

If only one non-commercial person complains about TVI/RFI then you're right. They don't care.

But if a whole neighborhood complains or a business is disrupted, They WILL get involved.

I had the local FCC authority knocking on my door over a local complaint and it was hell trying to prove it wasn't me. I was away on vacation at the time of the original complaint (saved my ass). The complaint was generated from a group of three local citizens who were experiencing Phone trouble.

As far as wether they care? You are right. They do have bigger fish to fry but by the same token the field offices have to prove that their existence is required. So to maintain their jobs, most will investigate even miniscule claims if there is enough people complaining.

I reported a single local business for splattering on on VHF-FM after trying to convince the 'Oil Delivery Service' of their problem. The FCC was on them like a fly on sh**. The problem got rectified (dirty final in the base station radio).

I think it is a very dangerous statement to make that the FCC doesn't care for at some point any one of us may find ourselves being scrutinized. And if we don't take the possibility seriously, then we have no right to cry about it when we get slapped with a big fine and/or lose our equipment.

: (eg. Radio ID # 1234567890) would code out to;
: System ID = 1234
: Fleet ID = 567
: Unit ID = 890

All this info is available in the RSS manual available from Motorola. What he's looking for is the format of the encrypted system key. The system key is necessary to program the radio. Knowing a radio id isn't much help if you don't have the system key.

In the US -

You can't legally manufacture an RF amp that works below 144 MHz unless it
is FCC type accepted. (There are limited exceptions for amateur radio
operators, essentially you can't build more than one a year or use a kit.)

An RF amp won't be type accepted unless it won't work on the CB bands.

I'm assuming MRF454's are transistors or tubes, not complete amplifiers.
I don't think there are any legal restrictions on these.

I still don't understand why existing OGA laws
aren't enforced when ANYONE shows up at a scene and gets in
the way - including the media. Having to arrange your
dispatching around what the newsies might do does not
contribute to officer (or public) safety.

When I was a dispatcher in Rochester, NY and worked
the City FD position, we were not allowed to say the word
"explosion" over the radio. We had to dispatch them as
"fire, type unknown" instead. To me, that caused
unnecessary risk to the responding firefighters because we
were withholding vital information, but the politicos
(anyone in Management) felt that it was more important not
to get the media excited. Little did they know how little
information the local media actually get from their
scanners...

>Is that one of them. How do you feel about MDT's? Just curious. I only

I'm in favor of MDTs to get the administrative
traffic and want/warrant/license/registration traffic off
the voice channels.

It is illegal to sell them. The FCC has conducted many raids on
companies that sell CB linears.

It is illegal to sell ANY electronic device without FCC approval.
Intentional radiators have to have type acceptance from the FCC before
they can be sold legally.

That is, it could be a legal type of equipment (two-way radio, etc.),
but it is still illegal to sell that item without a type acceptance.

>stock or Smiley antenna). It seems like the radio looses sensitivity
>with the external antenna.

Hi Dave,

Well, first of all I would check all the antenna connections one more time...particularly the BNC connector.

Assuming that works, I would guess that the mobile antenna is actually too good for the radio, and the added signal from other frequencies is creating intermod, and/or desensing. The Pro-62, and its cousin, the Pro-2037, is susceptible to this kind of thing.

Improving one's antenna is a conundrum...it can vastly increase intermod, because intermod is not a 'linear' combination of signals...ie a 10% increase in the offending signal can create a 50% or greater increase in intermod, even if the desired signal is also increased by 10%. On the other hand, a 20% reduction in antenna performance can reduce the unwanted signal enough to cut out intermod altogether...although the desired signal is cut by only the 20%.

Cheers
Paul

>should have used a soft case or something. Is there a softcase made just
>for the 43?

There is a company in California called DesignEQ that makes a case specifically for the PRO-43 (and for other handheld radios). It's run by a fellow named Howard, but I can't remember his last name... I think maybe is Borstein, or something like that. He's the same person who wrote the third party user's manual for the AOR AR-1000.

I used to have the DesignEQ web page address, but I've misplaced it. However, I found it by using one of the Web search engines, and searching for "DesignEQ".

If you need an exact address, I'll try to dig it out for you.

: : Could some one please explain, in a reasonably technical way, what
: : a 'trunked system' is? I have read snippets of partially correct
: : and wildly incorrect explanations, and I am still confused. I am
: : an electronics firm service manager, and a Ham operator, so please
: : don't be afraid to give as fully technical response as needed to make
: : the point. I want to be accurate if I pass the info on to others.

: : email or post - whichever suits you.

Well. On a conventional system, each "channel" has a specific
frequency. Trunked systems do not.

On a trunked system, say, for purposes of explanation, you have say 10
frequencies. NONE of these frequencies is set to a specific channel, but
shared among all "channels".

A unit, wishing to use the system, keys his microphone. The radio grabs
the _first available frequency_. All other units turned to this
"channel" automatically tune to this frequency. When the unit unkeys his
mic., the radio begins scanning the 10 frequencies in the group. When a
response is transmitted, the radio again finds the first available
frequency and again, all radios switched to that "channel" tune to that
frequency. This frequency may or may not be the same one used before.
This goes on and on...

To the user of the system, her is unaware of all this. The conversation
continues just as with a conventional system. The radio control unit has
a channel selector, the whole nine yards. All the scanning and frequency
switching is handled "invisibly" to the user. Complex computer equipment
is used to keep the system going.

To a scanner user, however, things can get hairy. If you have your
scanner tuned to s specific frequency, you will hear part of one
conversation, then part of another, then, another still. A scanner does
not have the capability to find the correct frequency in order to capture
all the conversation in one piece.

Now to get more techincal. Technically there are _some_ frequencies that
are dedicated to specific use. One is the control channel. This
frequency all radios monitor. This frequency is where radios are told
what frequency to turn to, and other information.

Some frequencues may be set aside for uses such as telephone connections, data communications for in-car computer terminals (MDTs), and other uses outside the normal talkgroup.

I have found the best way to monitor trunked comms is to simply enter in all the _mobile_ frequencies in and monitor them. You will not hear the dispatcher, or units more than a couple miles away, BUT you will hear all the traffic occurring close to your location. Once a user unkeys, my scanner begins scanning, and grabs the frequency the conversation is continuing on. It is important to have your delay turned OFF.

Hope this helps.

Tjhis is typical of the output of most headphone jacks, and even some dedicated TAPE REC jacks. If you filtered that output, you'd degrade the speaker sound quality, and you don't want to do that.

Best bet is to install your own TAPE REC jack. Connect the (+) leg of a 2.2-uF capacitor to the "high" end lug of the VOLUME control. (Not the middle lug nor the end lug that's grounded.) Connect the (-) leg of that capacitor to the center or hot lug of an appropriate jack, say a 3/32" mini phone jack. Connect the shell or ring/ground lug of the phone jack to circuit-board ground. Then plug a cable into that jack to go to the recorder. The signal will be LINE LEVEL, ideal for recordings, and independent of the volume control setting.

5268. 800 reception problems

Newsgroup: rec.radio.scanner
Date: 1996-09-19 00:00:00 UTC
From: "Sonny J. Lewis" <lewis.473@osu.edu>
Message-ID: <01bba685$ac685340$9670fe8c@lewis.473.acs.ohio-state.edu>
Source record: 222597
Cross-posted to: rec.radio.scanner,alt.radio.scanner

When listening to the 800 system here in Columbus and I use an 800 antenna, I pick up what sounds like the control or perhaps MDT data on every channel; this usually only occurs during heavy system use, and only with the 800 antenna. With a 2m or 460-band antenna, usually no problems, but poor voice reception makes it almost unbearable. Only noticed with a Pro-2026; not a problem on the others.

Any ideas/suggestions/cures for this?

Sonny

Source record: 222600

Hello,

I am interested in purchasing a PRO-29 from my local Radio Shack. I'm new to scanning and need some advice about this scanner. The specs. are as follows: (as much as the Radio Shack dude could give me over the phone)

PRO-29
$149 (on sale, regularly $219)

60 CHANNEL
Frequency ranges are: 29-54, 108-174, 406-512, 806-823, 851-868, 896-956 mhz.

The price is what I'm attracted to, however, I'd like to know if I'm going to be severely limited here because of the frequency restraints. Also, I'm not sure if this scanner has been out for very long, so I'd like to know if anyone has come up with any mods for it.

Please give me any opinions or advice about this unit. If you know of a better scanner that is within $50 of its price range, Please email or post a response (preferably email).

Thanks in advance.

I keep hearing this comment (WS-1000 is better than R1), but looking at the specs for the WS-1000, it seems to lack multiple search ranges (the R1 has 10). The R1 also seems to have a more convenient keypad (normal layout, not a two column layout) and a more rugged case (half of the R1's is metal). It seems to be smaller, but better? I'm not convinced of that yet!

Howdy,

I too use the 2/9/L.O. method for cellular restoration, it work's well. I have another question though, does anyone know how to disable the "beep" in the Pro-51? Mine has the date code 11A3. My wife is driven crazy by the beep, she can hear it even when I'm using headphones. Also Radio Shack sells a telescoping antenna with a Molded coil in the center, if you don't have one of these, get one. It's the best handheld scanner antenna I've found. Really helps the 43-46 MHz band. If anybody knows of a better antenna for portable use, I'd love to hear about it.

Those of you who constantly criticize Bill for what he says or he does
and would like to drive him out of the scanning newsgroups, think twice.

WHICH OF YOU WOULD TAKE HIS PLACE AND CORRECTLY ADVISE SO WELL THOSE WHO
NEED OR WANT SOME ANSWERS (NEWCOMERS AND CO.), AS HE OR BOB PARNASS DO?!
Yes, I agree: they have different styles, but both are HELPFUL at last.
Bill is one of the few around who can at least partly live off scanning.
Just ignore what you don't like, he doesn't force you to buy anything.

Now, please, don't jump all over me. I don't have Bill's time for this.
Instead you could rather learn how to describe things like his answer in
"Which one R.S., 2004/5/6..." of Wed. 09/18, or the many before, after.

Remember, take it easy. I WON'T EVEN RESPOND. I have better priorities.

5287. Cordless Ant plans

Newsgroup: rec.radio.scanner
Date: 1996-09-19 00:00:00 UTC
From: "Randy B." <RandyB@DNC.net>
Message-ID: <3241E16C.5A84@DNC.net>
Source record: 222616

Attached is the plans to a cordless phone monitoring antenna I found while sifting through some CD-Roms. Just thought you might find it interesting. I've built it, but I didn't originate it. Enjoy!

```
**************************************************************************
* Cordless Telephone Antenna -A.G.TENNA- August 3, 1989 *
* Designed by: Adam Gott (On GENIE: A.GOTT) *
*------------------------------------------------------------------------*
* For latest UPDATE, call: The Hole in the Wall BBS *
* (415)/524-1329 *
**************************************************************************
```

Introduction:

Below is what I have been using for quite a long time now to stretch the reception range of my scanners on the cordless phone/baby monitor frequency ranges. Using this antenna, I have been able to receive about 10-15 more cordless phones than with my discone or telescoping antenna. I hope you will find this useful! Remember, that stupid E.C.P.A. does not apply for these devices!

Required Materials:

Coaxial cable - 50 Ohms - length variable depending on usage
Connector (to match your scanner)
Wire - Any kind, 30 feet or so

Instructions:
---

1. Attach connector to one end of the cable.
2. On the other end, strip off outside covering (about 1.5 inches). Twist braiding together.
3. Strip about .5 inches from center conductor.
4. Connect 10 feet of wire to the center conductor. Soldering is the most preferred way to go here! If not, then tape it up with electrical tape.
5. Connect 15-30 feet of wire to the braid. Solder this also.
6. Tape (or use some type of sealant) on the connection area at the tip of the cable.
7. Finished, now hang it somewhere. Best results are obtained by stretching it end to end as high as possible, but in front of a window produces good results. Draping it

out the window is even better. Just try to keep the two
wires from running next to each other, this degrades
A.G.TENNA performance slightly.
8. Refer to below 'illustration' if you have any questions
or I can be reached on GEnie or The Hole in the Wall.

Illustration:

'A'
<--------10 Feet------------->
------------------------------c 'B'
c <-----------15-30 Feet------------->
bcbbb-------------------------------------
bcb
bcb
XXX KEY: XXX = coaxial cable
XXX b = braid on cable
XXX c = center conductor
XXX --- = ANY wire
XXX
XXX
XXX

Cordless Telephone/Baby Monitor frequency review:

Base frequencies: 46.61 to 46.97 Mhz
Handset frequencies: 49.67 to 49.97 Mhz

Baby Monitors: 49.00 to 50.00 Mhz (reported)

Please for info!

If you live in CA, especially the SF Bay Area, please call
me on The Hole in the Wall. I am looking for people to swap
frequencies with. I also need some good bbs's to call, like:

Spectrum Analysis Center - (714)/532-2300
A.N.A.R.C. - (913)/345-1978

Thanks to these bbs's for all the information that we have
shared. And join Radio Communications Monitoring Association,
I finally did! (PO Box 542, Silverado CA, 92676, $18.50)

- Adam Gott -

Shut up yourself, FOOL. I was not the one discussing X-301, I was
taking
Bill to task for suggesting poeple use a metalic screwdriver to adjust
an RF circuit. If you have ANY technical knowledge at all, you know
that is
a BIG problem.

It sounds like you are the one who shouldn't get involved because
you don't know what the fuck you are talking about.

IT IS ILLEGAL to offer a non-type-approved linear for sale to anyone except another ham, and even then, only if it was originally built for personal use. To manufacture linears for resale without FCC type approval IS ILLEGAL!!! And the FCC WILL NOT type-approve a linear for sale in the U.S., that is capable of being tuned to 11 meters. And a non-ham is not allowed to modify a linear so that it can be tuned to 11 Meters. Just in case you were wondering...

Ha> From: Harcus <Tarfumn@worldnet.att.net>

Ha> I'm curious, I work as a police dispatcher. What do you folks like
Ha> the most of your hobby, what do we dispatchers do that frustrates you.

Mumbling with a mouth full of food. Whispering/speaking below the level
of the dispatch tones. Not knowing the city/town they work for and the
landmarks of that city/town.

I began monitoring way back in 1947 when we had 12 agencies sharing one
dispatch frequency (2490Kc), and sworn personnel worked the mikes.

I was with the PD from 1965 - 1975 and with the FD from 1975 - 1988.

The frustrations began when the city started hiring civilians for the
dispatch centers (PD and FD). The officers and firefighters who used
to work the mikes knew the city inside-out. That's not a requirement
for dispatchers these days, and their ignorance shows on the air.

: : a 'trunked system' is? I have read snippets of partially correct
: : and wildly incorrect explanations, and I am still confused. I am
: : an electronics firm service manager, and a Ham operator, so please
: : don't be afraid to give as fully technical response as needed to make
: : the point. I want to be accurate if I pass the info on to others.

: : email or post - whichever suits you.

Well. On a conventional system, each "channel" has a specific
frequency. Trunked systems do not.

On a trunked system, say, for purposes of explanation, you have say 10
frequencies. NONE of these frequencies is set to a specific channel, but
shared among all "channels".

A unit, wishing to use the system, keys his microphone. The radio grabs
the _first available frequency_. All other units turned to this
"channel" automatically tune to this frequency. When the unit unkeys his
mic., the radio begins scanning the 10 frequencies in the group. When a
response is transmitted, the radio again finds the first available
frequency and again, all radios switched to that "channel" tune to that
frequency. This frequency may or may not be the same one used before.
This goes on and on...

To the user of the system, her is unaware of all this. The conversation
continues just as with a conventional system. The radio control unit has
a channel selector, the whole nine yards. All the scanning and frequency
switching is handled "invisibly" to the user. Complex computer equipment
is used to keep the system going.

To a scanner user, however, things can get hairy. If you have your
scanner tuned to s specific frequency, you will hear part of one
conversation, then part of another, then, another still. A scanner does
not have the capability to find the correct frequency in order to capture
all the conversation in one piece.

Now to get more techincal. Technically there are _some_ frequencies that
are dedicated to specific use. One is the control channel. This
frequency all radios monitor. This frequency is where radios are told

what frequency to turn to, and other information.

Some frequencues may be set aside for uses such as telephone connections, data communications for in-car computer terminals (MDTs), and other uses outside the normal talkgroup.

I have found the best way to monitor trunked comms is to simply enter in all the _mobile_ frequencies in and monitor them. You will not hear the dispatcher, or units more than a couple miles away, BUT you will hear all the traffic occurring close to your location. Once a user unkeys, my scanner begins scanning, and grabs the frequency the conversation is continuing on. It is important to have your delay turned OFF.

Hope this helps.

This would be the leather case. in the 97 catalog it is on page 43.
I would see if some of the ones on page 42 would work as they have a
window for the display and a open square for the keyboard. They are
for other model radios but is they fit.

Maybe the one responsible for all this also uses forged email
addresses. (By the way, when I try to reply to yours, its returned
'not found')

Its not on my server because it ordinates elsewhere. When my server
sees the path contains "interlog" in it, its ignored thinking its
already here. Thing is, its not. That's why I did not see it and only
the replies of others.

I have no way of proving this but then again I don't care to waste any
more time on this issue. The one responsible is getting just what he
wants. A few laughs and the attention. I guess when your up against a
wall resorting to forging posts is the only way out.

Shall we think hard, really hard who would waste so much time? How
about looking at rec.radio.scanners Do I need to spell it out for
you?

Thanks for your concern.

5309. Why does my pro62 have poor reception with roof-mount antenna?

Newsgroup: rec.radio.scanner
Date: 1996-09-19 00:00:00 UTC
From: dber@tiac.com
Message-ID: <3240b070.15938013@news.tiac.net>
Source record: 222736

This one puzzles me.

I was able to pick up a used pro62 for a nice price to use as a spare carry-anywhere radio. With the stock rubber-duckie it receives very well. With my replacement 18" whip "Smiley" antenna, it works extremely well. When I hook it up to my external roof-mount antenna, only *very* strong stations come in (and not very well) and weak stations barely at all (they would come in fine once I replaced the stock or Smiley antenna). It seems like the radio looses sensitivity with the external antenna. It's a 2M ham antenna, but it has always worked (and continues to work) faithfully with a BC3000. With the 3000, it will extend the range greatly. I can't understand the performance loss with the pro62. I thought at first is was overloading the front end, but strong signals still come through. Weak signals (which can be heard 50% or better with the rubber duckie) don't come in at all with the external antenna.

Any ideas?

Thanks in advance and take care,

Dave Bernazzani

5310. BC-148XLT Mod

Newsgroup: rec.radio.scanner

Boys 'n girls:

I can't vouch for this hack, but "KpTn KaOs" swears by it. Somebody
try it and let me know if it's any good. Found it laying around on my
BBS and don't know what to do with it.

Bill Cheek
Scannist Extraordinaire

==========

Modification To Expand
Uniden / Bearcat 148XLT
From 20 To 100 Channels

Another Phyne Phyle From

KpTn KaOs

I have not found any Mod's for the BC148XLT or any of the other
BC "lower end" products. As yet I am still hacking the 1619a CPU
in the 148XLT so do not have the mod for 800mhz or even know if
it (1619a CPU) is capable but more on that some other time.

Take the bottom cover off of your 148XLT and familiarize your-
self with parts placement. Locate the PLL board. For those of you
who don't know what I'm talking about, it is soldered to the main
pc-board by standoffs and has a crystal glued to the top of the
PLL chip. Place the scanner so that you are looking at the PLL chip
and crystal on the bottom of the PLL board and the 2 tuning cans
are near the upper lefthand corner.

```
--------------
!cans !
!here !
! !
! ! The resistor that you will
! X ! Remove is here. The SMT goes
! ! underneath it.
This is where you ! !
will be making the ! -P- ! PLL with piggy backed
modification. ! X -L- ! crystal (10.400)
! -L- !
--------------
```

Located to the left of the PLL (where I put an "X" above) you will see two spots of silver where a surface mount resistor should be. Obtain a resistor # 102 or 105 from the electronics surplus store or if you're like me, you have a nice little puppy who has a taste for television remote controls who has added a remote or two to your parts bin. Carefully remove the SMT resistors from the remote and solder one where the X is.

Now to the right of the PLL (holding the board as above) you will see a resistor along the board on the edge and to the right. If you remove this resistor CAREFULLY, you will find a place for another 102 surface mount resistor. Solder it in place and replace the 1/4 watt resistor that you removed. You will now have 100 channels but the scan rate is still 15 channels per second until I write that file. Happy scanning!

If you want to go cheap and easy, then try your local Radio Shack.
They sell a suction cup window mount with a length of about 5 feet of
cable that terminates on both ends in a BNC connector. You can also
buy the scanner antenna from them.

Ya know, as I'm writing this, it occurred to me that you might be
talking about a mobile antenna. If that's the case. . .sorry. . .can't
help ya there. Barry WA2KLS

I am attempting to input heartrate data from a Polar heartrate monitor into my Macintosh computer using my scanner.

What frequency does the Polar transmitter belt transmit on?

What software can I use to read the analog (audio) signal from my RS Pro-62 scanner?

Any help would be greatly appreciated.

I just changed the crystal in my PRO2022 to speed up the scan/search speed, does anyone know how high you can go before it will cease to function properly, I presently have a 4 Mhz crystal in it (double the orginal 2 Mhz) it seems to still function properly after a quick test.
thanks,

Re: MX7000 mods

There are sevral mods for this unit, the most common of which is to increase scan speed. According to my "not-so-precise" calculations, this radio putts along at approximately 3.6 channels per second before modification. A far cry from some units today that will do 35+ per second! After modification, we have found an increase to 5.3 per second. While this is not a blaze by any means, it will help.

Locate and remove...CAREFULLY... R56 which is a 150k 1/8 watt resistor located near the processor, close to the side case. Replace this with a 56k 1/8 watt resistor to increase scan speed. DO NOT overheat this area of the board with your 200 watt solder gun! You are working in close quarters with the display assembly!

Other mods include elimination of Keyboard "beep" by removing or increasing the value of R-137, a 1k resistor located near the TDA2002 audio amp. A 22k resistor in its place makes the audio beep available, but at a significantly reduced level.

Other mods include RF shielding and RFI interference caps mounted on the process board. E-mail for lenthy details on this mod.

NOTE: The MX5000-MX7000 radios were one of the first continuous coverage receivers made and there are a lot of them out there. Baby the keyboards for these units. Once they're gone, there are no more replacements from Uniden!

>scanners(not including the upperend stuff) I have decided to look for
>one of those. Are there any to avoid? I am assuming that all are cell
>modifiable if they havent been done already.

Confine your search to the PRO-2004/5/6 and frankly, eliminate the PRO-2005. The 2005 is an "ok" scanner, but it's a pretender to the 2006 throne with none of the advantages of the 2004.

My favorite is the 2004, but that does not necessarily apply to you. A production defect at the factory in 1985 or 86 caused many (thousands?) of 2004's to leave with varying degrees of problems. Some were detected and repaired within the warranty period. Some shortly thereafter. Others went for months, or years and then failed.

If you are not capable of maintaining and servicing the scanner, it might not be wise to get a 2004 unless you can ascertain its history. A good clean one that's never failed and still works fine is likely to be safe now. But you're not likely to be able to determine that.

Soooooo, for most people, the PRO-2006 is the best bet.

The 2004 isn't quite up to the standards of the 2006, but can be made so with a few mods and hacks. The 2004 has a decided advantage of being all-metal with full shielding, and it has a gymnasium-sized space in which to work and to install mods. The sloping front panel with the tactile keypad remains the superior scanner design of the last two decades.

But, if you have a chance to snag one, you'll need to be prepared for the worst in the event it comes from that trouble-prone production run. Repairs can be either expensive or impossible. Tandy no longer supports it with spare parts and service manuals (it's been off sale for over 5-years now), so those who own one are pretty much joined with it at the hip.

The PRO-2006 is the safest bet and the most modern, though electrical differences between it and the 2004 are not very significant. In

fact, the PRO-2004/5/6 are pretty much clones with only minor electrical differencs. Prices on used 2006's can be expected to be no lower than $250-$300 and frankly, I haven't seen any of recent times for less than $350. Used 2005's ought not be more than $100-$150. Used 2004's range anywhere from $25 to $300 or more.

The newer PRO-2035 and PRO-2042 are also clones of the 2004/5/6 series, but are not capable of cellular. Their keyboards are absolutely horrible.

Your choice.....between a 2004 and a 2006.

Re: Pro-2022 Mods

Scan speed on the pro-2022 scanner can be increased dramatically
by changing the clock speed resonator crystal from 2 Mhz to a
speed of 4 Mhz and higher. On some units I have gone as high as
6.4 Mhz, but I have found some units will not handle speeds above
this range.

Simply replace X1 which is a ceramic resonator located near the
processor with an available crystal above, but not over 6.4 Mhz.
Remember that increasing clock speed will also reduce delay time
if the delay function is used on a channel.

It would appear Beep delete can be accomplished by removing any
one of three resistors in the output line of pin 9 of the mpu
GRE0620A. These include R196(1k), R158(1k), or R133(100k).
Other options include switchable beep by the addition of a
switch in line with this output.

Other generic mods include s-meter, tape aux. outputs, etc.
Bill Cheeks "Scanner Modification Book 1" has other mods for
additional channels if 200 isn't enough!

Good luck and Enjoy!

Re: MX7000 mods

There are sevral mods for this unit, the most common of which is to increase scan speed. According to my "not-so-precise" calculations, this radio putts alongat approximately 3.6 channels per second before modification. A far cry from some units today that will do 35+ per second! After modification, we have found an increase to 5.3 per second. While this is not a blaze by any means, it will help.

Locate and remove...CAREFULLY... R56 which is a 150k 1/8 watt resistor located near the processor, close to the side case. Replace this with a 56k 1/8 watt resistorto increase scan speed. DO NOT overheat this area of the board with your 200 watt solder gun! You are working in close quarters with the display assembly!

Other mods include elimination of Keyboard "beep" by removing or increasing the value of R-137, a 1k resistor located near the TDA2002 audio amp. A 22k resistor in its place makes the audio beep available, but at a significantly reduced level.

Other mods include RF shielding and RFI interference caps mounted on the process board. E-mail for lenthy details on this mod.

NOTE: The MX5000-MX7000 radios were one of the first continuous coverage receivers made and there are a lot of them out there. Baby the keyboards for these units. Once they're gone, there are no more replacements from Uniden!

> how do I add the 4 channels with a jumper?
>
>>>>
RE: BC175XL Channel mod

First off, make sure your processor is marked UC1115 or UC1115A. As far as I know, there are 2 processors that were used in this model, an old version and new version. If the processor is marked UC1082, I have no pinout of the mpu.

If it is the UC1115, simply install a jumper on the open "pads" that lead from pin 67 and 69. That is to say, jump pin 67 to 69. This will turn pin 69 of the processor low(ground) to enable the extra 4 channels.

Good luck and enjoy!

If you can get ahold of a 2004 in good condition, GET IT. It was the last RS scanner (that I'm aware of) to have a metal case. This allowed for much better shielding from extranneous sources of interference. The only thing I didn't like about it was the membrane-type keypad. Much prefer to have BUTTONS.

>
Thank you for your honesty. There were a bunch of No-brainers
who took me to task when I mentioned that the police dept want
to be on digital or trunked so the press don't KNOW. From two
"reality" illiterates they told me how uninformed I was and that
the getting digital and trunked to be able to "jump in" before
the press arrives was an "illusion" of my making.

Great that you conclude what was yours to give, without any
one telling you what you do when dispatching and why. My
experiences as a breaking news videographer for the last
17 years (still photograhy too) is now verified in what I
concluded about "reasons why digital or trunked is used"...

for all you who listened to this "low-charged brain-stem"
hey, when you see it written from the person with the scars
from dealing with the cops and the dearth of the earth who
a lot of news scenes are about...believe it.

Again...thank you for your honesty as a dispather. The dispathers
I have spoken to over the years say same as you, plus a lot more.
Not having the press at a scene makes the job easier for the cops
because the police need time to "determine what happened" and some
press types are very uncivil and very insensitive when it comes to
major crime scenes where the cops really need space ... the Press
can be a pain at times....improperly trained reporters and camera-
people screwing things up because they never went to a class in
school titled: "It Can Wait".

>Why, it's not illegal to sell or own one... It's illegal to USE ONE!
>And it's only illegal if you get caught.

Sorry, Jerry, you're wrong here. If you are caught with an amplifier capable of being used on 11m CB, and you're not a licensed ham radio operator, the FCC will PRESUME that you intend to use the amp with your CB, and you are guilty. If you're a ham, and you get caught with an amp connected to an 11m CB, you're guilty also. You do NOT have to be caught operating the amp on CB to get "busted"!

The FCC occasionally sets up at truck weight stations along the interstates and busts truckers who are using amps. Most of them have the amps just sitting in plain view on top of their CBs on the dash of the tractor.

This information comes directly from the FCC Field Office in Dallas!

Try the regular uplink/downlink freqs.- 407.850 & 415.700, you might hear them hook up with "Crown Control" depending on whether you are near a site. Also check the airport control tower.
You wont really hear anything too exciting and they will probably "go with secure" soon after the link is established anyway, but give it a try.

I just read an article in "Worldradio" summarizing the Washington state radio regulation issue. It seems everyone got all worked up over nothing (but that NEVER happens in rec.radio.scanner, does it?).

What the State of Washington wanted to do was regulate the use of mobile phones in order to improve road safety. If you've ever had a near-miss encounter with some dunderhead blabbing away on the cellphone and confusing their automobile with their living room, you would appreciate the value of such regulation.

Unfortunately, the proposed regulation was overly broad and COULD HAVE BEEN applied to other two-way radio devices in automobiles. This was a legitimate concern and has been appropriately addressed. "Appropriately" does not include clueless flaming in newsgroups, by the way. The people concerned contacted the agencies involved directly and advised them of their concerns, resulting in withdrawal of the proposal as written.

For Christ's sake... you are bigger nitpicker than me! In this arguement it is quite easy to infer that the words "owning" and "possesing" can be interchangable for the purposes of discussion. And besides - I clarified that in my response by agreeing in my first sentence that there was no authorization to own anything provided by an amateur amateur license but that, "so to speak", it did. But in additional to snipping the regs, you snipped all of my comments...

I wrote (quoting with my typos): "The license itself does not authorize ownership of equipment. However if you hold a licnese, the rule authorize possesion of equipment that might otherwise be prohibited. So yeah... an amateu license does give you persmission, so to speak, to own certain equipment."

But hey - you're right. The FCC won't ask you for the "pink slip" on your linear. However - if you are not a ham, it would be illegal to buy a CB amp since, without a type acceptance, it would be illegal to sell it. In a roundabout way, you CAN'T own one if you can't buy or build one. But that changes hen you have an appropriate license.

So for the rest of you that want to post arguements. If you are
inclined to write "own an amp" in a future post, please replace it with
"possess an amp" ... then we can argue the points of the regs.

Has anyone found any other use for that VADER besides with the CE232. The OS456 or the OS535 needs the VADER but the guys in Ohio don't seem to be up to it. Is there someone to write software for the VADER as I pull out the HB232 (CE232) and replace with a OS456? Why hasn't someone created an OSXXX based recorder that records using your sound card?

I like it when our local police dispatcher is more verbose than most...
He kind of fills in the details you might otherwise have to guess.

for instance, "this is the same guy who always calls when the highschool
football game is on..." or "This is the same lady who is 10-(code for
nutso)... and always says she is being watched...

Things like that make it interesting, and probably helps the officers out
a little too.

Hi

I am looking for a small bug (fm transmitter)
I need one that is out of range of *most* scanners.
looking for one in these freqs:

55 to 80 mhz
175 to 380 mhz
or any other odd freq!

I dont want one of these cheep 89 to 108 mhz fm kit jobs that just
anyone can hear.

Who sells such a critter????????

B> the getting digital and trunked to be able to "jump in" before
B> the press arrives was an "illusion" of my making.

Tell me something...

Police have cars out all over the area. They don't dispatch a call until someone is clear to respond. Media, even in cities the size of San Diego, have VERY few crews just hanging out waiting for something to break, and they SURE don't have time OR $$ to cruise all day long hoping they'll be near a breaking story. So exactly HOW does the media 'get there before the Police'?

... The more I learn, the less I know.

Message-ID: <32436CDD.72F1@netnitco.net>
Source record: 222491

After easily Modifing my bc175xl the other day, to get 4 more memory channels, I started to wonder if this mod would work on other bc scanners if they had the same cpu. There are 4 other so called 16 channel bc scanners, they are the 142xl, 145xl, 147xl, 148xl. The key here is the vc-1115 and vc-1115a cpu. it is a 20 channel cpu. It was fanily used in the bc172xl with all 20 channels hooked up. Below is a repost of this mod:

If you have a 16 channel bc175xl ,you can add 4 more memory cannels to it very easly. If you have cpu# 1115 or 1115a you can do this. On the top left corner of the cpu count down 5 pins. If you can read the name on the cpu and it is up right and you go to the left you are at the place for this for this mod. Beside the 4th and 5th pins on this side, there is a solder pad, an 1/8 of an inch to the left is another solder pad. Make a solder bridge between them and you will get 4 more memory channels.

Brad

Darren:

How can being a licensed ham make any such difference as you claim?

An FCC amateur radio license carries with it no permissions of any
kind to own anything whatever. If you had a license and knew how to
read and understand it, you would already have known that.

>part of the message, not the header.

I came in late, so I may be off on another tangent entirely, but if we're talking about the headers such as the one on this very article, it's edited as the first few dozen lines of the message body. In trn, which is what I use, it passes the entire thing to Pico (or emacs, depending on what mood I'm in) with lines for Newsgroups, Summary, Expires, References, Sender, Followup-To, Organization, Distribution, Keywords, and Cc. I'm sure there'd be more if I didn't just use the defaults. Anyway, you modify these lines (which are in the 'body' of the message, technically, at the time you're composing it) to make changes to the headers. For example, I'll take all but the rec.radio.scaner out of the Newsgroups: line so we don't bother everyone else with this stuff. (Sorry, r.r.s.. :)) I can then remove some of the other lines I never use, like Summary, Expires, and Distribution. I can override the default Organization line with one of my own (however, my mail server might re-override what I've put in, I dunno) and so on and so on.

So yes, you can alter the headers in the 'body of the message', as it were.. Ron is right.

Now, back to scanning.. (*please*..)

..J. lowj@cuug.ab.ca

>Weak signals (which can be heard 50% or better with the rubber duckie)
>don't come in at all with the external antenna.

>Any ideas?

It's most likely overloading. The symptoms you describe shows
degraded sensitivity since you don't get the weaker stations and
this is one of the classic symptom of overloading. I don't know
the PRO-62 personally so I don't know if it has an attenuator
switch or programmable attenuation. If so, you might experiment
with that.
The BC-3000 it one of the best handheld scanners available and,
although not perfect, it behaves well when exposed to strong
signals.

>Thanks in advance and take care,

Hi,

And thanks for reading my post, I am wondering if anyone has a listing of the freqs for Foxboro Stadium ....?

How about the the freqs of the headsets ????

Thanx Keith ...

> 2.My favorite document is doomed.....

From what I have found the source is the City of Oakland, calif.
they passed a law against cable theft and the powers of the cable
companies to recover their losses...giving them the right to do
things outside the law...I think the San Francisco Bay Guardian
did a story on this nazi-like law.

this was back in the late 70's or early 80's....

BayGuardian has a www site....i'm still trying to get more info
for completion of this post.

From someone who has an id address as: cheek=shit@yomama.ilk,
I can surmise that because he has substance and you are still
looking for a friend, that the mind-stem you carry with you has
a magnanimous amount of "aberrant-synspses" going off from your
mindless wit...you are a legend in your own mind, agreed.

i guess your day-care teacher did not do her job on you. you need
to clean more assholes to really get the flavor right. Apply at
most Mental Health Wards and they will be glad to put you to work
for the task you seem ever-so qualified for...that of "ass-sniffer"

And while you are there...hey, stay awhile. I am sure the people
keeping detailed notes would be glad to have you "sing your putrid
songs" as you do so well here...showing one and all that you are at the
wrong address.

and one day you will be freed of the weight you carry around within
your deepest-held illusion: that your matter. ...that someone does
care.... ...that ugliness is them.

I'm using Radio Shacks 40 channel CB transceiver TRC-226 (Realistic).
It came with a metal telescopic. I want to put a rubber duck on it. I
found a rubber duck in a store and bought it for very cheap not knowing
weather or not it is infact a CB antenna. Anyway I have two questions,
how/what equipemnt is need to test this rubber duck to see if it is
indeed a CB antenna? The second question is that with this unit above,
can one transmit without an antenna will it damage the unit?

Please respond directly to me. Thank You

>manual show this as being possible only on an individual channel basis
>which is very time consuming.
>

I think that requires a full microprocessor reset which consists of soldering. I think that if all memory channels are cleared ...the unit malfunctions and that may be why they do not tell you to do that.
I own a AOR1000 not the 1500. But anyway.. my point is that I had to buy a book published by Howard Bornstein called , "Guide to the AR1000" because the manual assumes that you are the one who designed the damn thing!!
I think he wrote a book for your model which is not very different from mine in that I think yours has a BFO.
His information is:
Howard Bornstein
P.O. Box 1245
Menlo Park, CA
94025

I think I paid $19 for my book which came with some nice index card sized quick guide cheat sheets and some other neat little things.
My books talks about users having problems clearing too many memories and having the unit lock up on them.
Good luck!!!

>Phil

I just listened in on Airforce One landing here in Seattle on the regular commercial air frequency of 126.900 I am sure they use 415 in the air or something, but at least when landing at a commercial airport (Boeing Airfield in this case), they use the regular freq's. I also heard the Navy follow planes from Whidbey Island NAS checking in on the commercial freq's as well, letting the tower know AF1 was in sight and all that.

The person speaking on board was very interesting to hear. VERY good signal, with bold clearly spoken transmissions, unlike normal airline-speak. Every transmission ended with an identifier of 'Air Force One'.

Just as a footnote, yesterday I was stuck in the unbelievably HUGE rolling backup on Interstate 5 behind the presidential bus-motorcade.

>
> An FCC amateur radio license carries with it no permissions of any
> kind to own anything whatever. If you had a license and knew how to
> read and understand it, you would already have known that.

The license itself does not authorize ownership of equipment. However
if you hold a licnese, the rule authorize possesion of equipment that
might otherwise be prohibited. So yeah... an amateu license does give
you persmission, so to speak, to own certain equipment.

To be rhetorical, as you were with Mr. "Stevens"... If you had a license
and knew how to read the rules, you'd know that.

Please see 95.411:

"(c) The FCC will presume that you have used a linear or other RF power
amplifier if -
(1) It is in your possesion or on your premises; and
(2) There is other evidence that you have operated your CB station with
more power than allowed by CB rule 10. Sec 95.410"

It should be noted that *mere possesion* is not a violation. Note
subparagraph (1) ends with the word "AND". This means that any
assumption by the FCC, under this rule, that you used an amp would be
based on possession AND other evidence, as described in (2).

Licensed hams fall under a clear exception when it comes to
possession...

95.411

"(d) Paragraph (c) of this section does not apply if you hold a license in another radio service which allows you to operate an external power amplifier."

However - an amplifier that is capable of transmitting on 11 meters will not get the required type accpetance required to be able to market it for sale. There are exception to the type accpetance rule on sale of amps between licensed amateurs, or dealers that sell such amps to licensed amatuers. See 97.315 for type accpetance requirements and exceptions.

I'd like to know where the text of the is "Cable - theft of service law". The claim made above is pretty outrageous. Right now I would say that I think someone is very misinformed if they think a comapny like TCI can break down your door to get an "illegal cable box".

In CA there is a law making possession of "unauthorized cable boxes" a crime (593d PC - penalaties can range from $500 to $10,000 and imprisonment). A search under the penal code could be conducted by police with the cable company but would require a search warrant.

Unlesss someone can provide references (CA code sections, local ordinance paragraphs, court rulings, etc) I would write the post off as coming from someone that heard just heard a wild story.

Regards

[Snip FCC regulations which make no mention of ownership of anything.]

That's nice, but I stick to my position. And if you don't yet
understand the difference between concepts of ownership, possession
and use, then please check out a dictionary and then please try again.

If and when someone shows a section in Parts 95 or 97 with ownership
of equipment mentioned, I promise to pay close attention.

Actually in Part 97 there is one mention of ownership, but that
relates to the obligation of a Station Antenna Structure owner to
register it using FCC Form 854. See S 97.15(d).

Oh you silly fellow you. The magnets in the D'Arsonval movement might magnetize the tip and then you'd be S.O.L. when you laid that screwdriver down on one of your floppy disks. You're handicapped enough as it is without taking on any more dead weight.

YOU would be better off using a popsicle stick. :-))

Sure is. Beats the snot out of RG-58 and is still small and flexible.
I wouldn't use it for lengths much greater than 25-ft. Any longer,
and I'd go for RG-6 satellite cable, or...if you're a "purist", use
Belden 9913....but that may be overkill for your needs.

Source record: 222656

baxtecr@wku.edu wrote:

>I need information on the Pro-2004 unit. I know there are several
>mods for this particular scanner. Could someone pass them my way?

There are 40-50 mods possible for the PRO-2004. The easy ones are:

1. Clip D-513 to restore cellular. D-513 can be on top or on the
bottom of the Logic/CPU Board.

2. Add a 1N4148 to the empty spots for D-510 for 100 more channels.

3. Add a 1N4148 to the empty spots for D-514 for a 25% speedup.

NOTE: DO NOT ADD A DIODE TO EMPTY SPOTS FOR D-511 or D-512. This will
alter the cellular spacing steps and other ungood stuff.

4. Clip, snip, or switch the wire in CN-504, Pin7, for BEEP disable.

5. Clip R-148 and solder a 68-k resistor between the cuts on the lead
of R-148 to improve the squelch action.

6. Add a 10-ohm resistor to the lug at CN-2, Pin 4, to improve the
clarity and volume at the HEADPHONE jack.

7. See my S-Meter Mod posted under another thread for this radio.

There are dozens of other mods that can be done to the PRO-2004, but
which do not lend themselves to ASCII text presentation in this
simplistic manner. They're published in books, magazines, and
newsletters with photos, diagrams, schematics, tables, charts, and
exceptional details. Such mods include:

1. Improved Tape Recorder Jack
2. Automatic Tape Recorder Switch (beats VOX!)
3. Extended Delay
4. Tone Decoder-Rejector Countermeasure
5. CTCSS mod
* 6. S-Meter
7. Scanner-to-Shortwave Interface
8. Carrier-On-Indicator
9. Audio Improvements
* 10. Beep volume or disable
* 11. Squelch Improvements
12. Remote Controller
13. Baseband audio outputs
14. Event Counter
-- 15. Shielding of plastic cases

16. External DC power
17. Improved Adjacent Channel Rejection
18. Speed up of SCAN & SEARCH modes
19. Interfacing to a computer
20. Subsidiary Carrier (SCA)
21. Extended Memory to 25,600-channels & up
* 22. Cellular restoration
-- 23. 54-88 MHz restoration
24. Data/Tone/Noise Rejector

* covered above
-- not applicable

>station. That's not the way it is in reality these days.

>Andy

Right on, Andy - The exams now-a-days are too easy! Any one can get lucky enought to guess the right tick box answers!

However, you can hardly blame newly licenced "hams" to go for the "black boxes" instead of home brew - To home brew a radio to the sophistication and performance of say an AOR8000 or a FRG9600 would be too daunting for all but the hardiest of home brewers. The (relative) low cost and outstanding performance and ease of aquisition makes the black box an automatic answer!

This temptation creats a culture of hams who have studied hard to get the licence and once they have it, they have no further interest in the technical aspect of the hobby, dont own a soldering iron and use their wallets as the means of getting their kit - woe betides us when the kit goes wrong!!!

Listen to any hame frequency and listen to the proud operator say that his Yaesu/Icom/Kenwood/ etc box .. very rarely now will you hear "It's a homebrew exciter with a pair of KT77's in the final etc"...Those were the days...

Yup, I got my licence nearly 30 years ago after a 2 hour written (not tickbox) exam and then a morse test to get an HF licence! - the only

way to get on the air them days, was to home brew! And home brew test kit to monitor what happens and how to fix it!

Most of you modern youngsters dont know your born! Pass me my walking stick and tickle the cat's whisker again... Any one got a cohearer (spelling?) for sale?

BTW: I have fallen to the temptations now - but I have an excuse - I am a G3 xxx !!!!!!

The LCD Display is the "thing" that presents the screen data. But as you know, LCD is hard to see in dim light. So, that scanner is one that has an "electroluminescent panel" BEHIND the LCD display that emits a uniform, soft blue glow that makes the LCD data contrast for readability.

EL panels are a bit of chemical wizardry with two leads to connect to a low-current source of high voltage AC...about 80-volts or so. After a period of years, the chemicals in the EL panel wear out. The glow dims at first, but eventually stops. That is the usual problem.

I suppose the simple DC-AC low current power supply in the scanner for the EL panel could fail, but this is rare. In any case, it's one or the other....a dead EL Panel or a defective DC-AC power supply. If you disasembled your front panel and looked BEHIND the LCD display, you'd see the EL Panel there and its two wires. A bit of white "glop" holds the EL Panel to the LCD display, and once broken loose, and the two wires unsoldered, the EL Panel slips out sideways....you'll then see the grooves behind the LCD display where it fits.

The PRO-2021 is so old, however, that Tandy won't be stocking parts for it anymore. In a word, you're S.O.L. But there are possibilities. You can use an EL Panel from the PRO-2004 or PRO-2022, which I think will be the same part and size. Trouble is, Tandy may not support either of these scanners any more. So, your remaining options are to make do with an EL Panel from the PRO-2005 or the PRO-2006. It will work, but is smaller than yours, and won't be as pretty.

Call Tandy Parts at (800) 442-2425 for the "low down".....

Message-ID: <32430743.2E1B@cougarnet.byu.edu>
Source record: 222660

Hello,

I am interested in purchasing a PRO-29 from my local Radio Shack. I'm new to scanning and need some advice about this scanner. The specs. are as follows: (as much as the Radio Shack dude could give me over the phone)

PRO-29
$149 (on sale, regularly $219)

60 CHANNEL
Frequency ranges are: 29-54, 108-174, 406-512, 806-823, 851-868, 896-956 mhz.

The price is what I'm attracted to, however, I'd like to know if I'm going to be severely limited here because of the frequency restraints. Also, I'm not sure if this scanner has been out for very long, so I'd like to know if anyone has come up with any mods for it.

Please give me any opinions or advice about this unit. If you know of a better scanner that is within $50 of its price range, Please email or post a response (preferably email).

Thanks in advance.

> there any freqs locked out?

The celluar freqs are locked out.

> What exactly is VFO Control

The large tuning knob has two modes - FREQ and CHAN. In CHAN
mode, turning the knob takes you up or down to the next channel
and whatever frequency is programmed into it. IN FREQ mode,
turning the knob changes the current frequency by whatever
the current step size is. The default step size depends on the
band you are in, but can be changed. I think this is what you
mean by VFO control.

> & Alpha Display.

When you program a channel with a frequency, you can optionally
enter some alpha characters that are displayed when the channel
is active and the display is in ALPHA mode. I think that there
are 16 chars available per channel.

I have bought a "Sky Scan DX" discone antenna together
with 9 meters of RG-213/U-BX coaxial cable, the BNC plug
was soldered to it by the radio shop guy, both parts
are for 50 Ohms. If I connect it to my Yupiteru MVT-7100
handheld scanner, the signals are just as strong or even a
bit weaker than with the cheap telescopic antenna which
came with the scanner. I went back to the shop and tried
out my cable and other cables together with some other
discones, always the same result. What is wrong?? I was
really looking forward to being able to receive a lot more,
and now this.. Please provide some input..

EXACTLY!! I worked @ RS for a while, and there were darn few products you couldn't find much cheaper at wal mart/K mart/Sams/Office Depot. With the exception of the aforementioned hard-to-find items RS still does carry a good selection, 'cause they have an *incredible* margin on these items...

W mart & the like have essentially ceded this market to RS, because of the technical know-how needed to sell these items, I guess. LOL

> Is it possible to order a new case for the pro-43 from Radio Shack?
> (the actual plastic case)

Tandy National Parts, (800) 442-2425 or (817) 870-5600, can ship you any part.
The PRO-43 parts list shows:

Ref.No Mfr's Part No.
(8) Assembly, Case, Front GA-91D-9416
(9) Assembly, Case, Rear GA-92D-9488
(13) Key, top GE-91C-9212

While Natl Parts prices are usually quite reasonable, custom plastic parts
are the exception. Three years ago the front assembly was $35. The key pad
is only a few dollars.

Yes they do. I had a RS 2m ham radio that got dropped into a lake during a canoeing trip. I got the $50 warrenty, if I do anything dumb they fix it. I took it to the store to be fixed. After two weeks I asked where the radio was at. They told me, whoops we forgotton to send it, it is collecting dust on our shelf right now. Since this was the second time that Radio Shack did the same thing I was less than forgiving. After a talk to the distict manager I got a new radio.

Two weeks later, I got a note that my old radio was repaired. I called all told them I already got a new radio. The saleperson told me no problem, we will put it back on the shelf.

Hmmmm....

i did the cell mod to mine about a year ago. it was easy as i remember.
if you don't get a reply, i'll open mine up and look what i did. email
me . . . i go out of town during the week, however, i'll get back to you.
i know how frustrating it is to want to make the mod and can't get the
info. fast enough.

5422. Kenwood TK-940 Commercial 800mhz Info Wanted

Newsgroup: rec.radio.scanner
Date: 1996-09-20 00:00:00 UTC
From: ronkatz@interlog.com
Message-ID: <3241d41d.6003451@news.interlog.com>
Source record: 222689

I have and am currently using a few Kenwood TK-940 radios.

If you are familiar with this radio I"m interested in hearing from
you.

I have a circuit that I want to add the radio to force the radio to
ignore specific transmissions that this circuit will detect.

What I would like to know is;

1) where is the Discriminator audio found in this radio.

2) If I want the radio in conventional mode, and during scanning to
ignore a channel and continue on to the next one, how do I do it.

How can I override the scan control. I do not need to make it stop
scanning. Only to tell it to continue scanning.

Do you know where the Commercial Kenwood department Tecs can be found?

I would like a Service Manuel and possibly some parts.

has anyone ever heard of this mobile scanner?

it's a pre programmed police/state patrol etc. type thing.

it is made by regency???

i'm looking for a manual or any info such as:

*) how fast do it scan?
*) what freq. are pre programmed in it? 800mhz too??
*) how old is it?

it seems to work well, but i'd like some info on it.

ps. 30 bucks with antenna, not a bad deal

5424. Radio Shack antenna amp. Does it work and worth the price?

Newsgroup: rec.radio.scanner
Date: 1996-09-20 00:00:00 UTC
From: rbackman@ix.netcom.com
Message-ID: <51t7a0$gtc@dfw-ixnews4.ix.netcom.com>
Source record: 222691

Hello all,

Would anyone care to share their opinions on the portable antenna amp offered by Radio Shack? Does it work?

It seems to be a large unit to suspend from a B/C connector...

Any information would be appreciated.

By the way, I use an AOR8000.

Thanks
Russ

5425. PRO-26 modification

Does anyone knows if there is (and what it is) a modification for the USA model of the PRO-26 from Radio Shack? I found a mod, but it only applies to the UK model of the PRO-26. I found in a book that it is available, but I can't find it.

Anyone can help me?
Thanks!
Guy

> your 200 watt solder gun! You are working in close
> quarters with the display assembly!

The only downside of this is that the "faster" scan/search speed could have adverse effects on the capabilities of the PLL being able to lock up. You coan "vary" the value of this capacitor to vary the speed and see which might work best. Quite often changing the orginal component traded overall performance for speed but you could find it vary from unit to unit.

> NOTE: The MX5000-MX7000 radios were one of the first
> continuous coverage receivers made and there are a lot of
> them out there. Baby the keyboards for these units. Once
> they're gone, there are no more replacements from Uniden!

The MX5000 was the Regency (Uniden) badged AOR AR2001. The MX-7000 was a Regency only model that was essentially the AR2002 (800-1300MHz added) in the older AR2001 case with membrane keypad rather than the "buttons" and revised front panel on the '2002. As Gerry says they are no doubt be in short supply one they "go" but you might also get some look via AOR.

Darren:

How can being a licensed ham make any such difference as you claim?

An FCC amateur radio license carries with it no permissions of any
kind to own anything whatever. If you had a license and knew how to
read and understand it, you would already have known that.

Harcus <Tarfumn@worldnet.att.net> wrote:

>I'm curious, I work as a police dispatcher. What do you folks
>like the most of your hobby, what do we dispatchers do that frustrates
>you.

Personally I'm a remember of the press and I monitor 6 radios in
my vehicle. What I like from the hobby side, is being aware of what
really is happening around the city. Having an "inside" view to
emergency services and what they do and how they do it.

What frustrates me is hearing dispatchers who are not trained
very well and forget who should have priority on the radio during
things like foot chases, and high speed vehicle chases. Often the
dispatcher does a wonderful job or relaying information but forgets
that everyone can hear what is going on and control I think should be
handed over to the officer trying to put updates over the radio. The
officers often attempt to get a word in but because every time the
dispatcher talks it forces the police officer in an emergency
situation to standby when often it is not necessary to repeat
everything.

Many persons using the radio system do not realize that unlike the
way dispatchers are hooked up to the radio system Police officers can
not interrupt other ongoing communications. They and everyone have to
keep transmissions short. Too many times I've heard a police officer
calling or help and others were not listening, or talking over him.
The radio system is not just a form of communications used for
dispatching but its also a life line.

>Most times a call of consequence comes in, we dispatch it
>digitally so that the TV trucks don't beat the police to the scene.

You worry too much about the media. If its really important we hear
it over Fire depts and Ambulance. Or its just a matter of time.

>Is that one of them. How do you feel about MDT's? Just curious.

They will cost a police officers life one day. Typing while driving,
or not getting the details about a call "NOW" over a radio. But in
text that was not read.

Its great for checking out markers, name checks or sending messages.
That's it. No one I know can type faster then they can talk.

> I only
>use my scanner to listen to the channels just prior to going into work.

> Then I know where I might want to work based on the dispatcher I have
>to relieve.
>

>Some are worse than others. Some dispatchers leave channels in choas,
>and frequently you can sit down and feel the hate coming from the
>street. I can usually calm it down in a few minutes, but its extra
>work I can do without.

Think of what your doing though. Its your job. You are the
police of the radio system. If you can bring law and order, and
continue to have control over the radio system, you are saving lifes,
Police officer, and the public. With out proper communications there
is kayos (sp) With out the dispatcher controlling that life line the
message just does not get ac cross.

> Plus some are very good about writing down
>officer safety info, and its well organized, while others don't bother
>to write anything down period. But then job burnout is pretty common
>in this job.

This is when you have to remember that it is just a job. Put it away.
If your listening to your scanner before you get in to work your
taking your job home with you. Monitor if you enjoy your work and you
really think it makes your difficult job easier.

Police officer often talk about the dispatchers. So does the media and
anyone else monitoring. Its a difficult job, many understand it. Its
even more difficult to take control and show the officers, that you
are in control and it is YOUR Radio system when you speak. I don't
know what any manual or communications sargent says but It really
becomes your radios system and you are giving the orders. You have to
make people listen. If they don't, its on tape. You did your job.

Cool,calm and relaxed.

I had a RS glass mount scanner antenna. It worked great above 150 mhz, but don't expect great results. The best antenna I have found is an Antenna Specialist mag mount (don't remember the model #), but what I typically use is a converter that I got from Grove that allows me to use the radio for my AM-FM car radio. Does a great job and cuts down on the number of antennas I have (cell phone and 2m/70cm ham antenna)

Those are for Australia!

The new the 25 channel models in the US operate on:

Cordless Telephone

Chan Base Handset Chan Base Handset

1 43.72 48.76 16 46.61 49.67
2 43.74 48.84 17 B 46.63 49.845
3 43.82 48.86 18 C 46.67 49.86
4 43.84 48.92 19 46.71 49.77
5 43.92 49.02 20 D 46.73 49.875
6 43.96 49.08 21 A 46.77 49.83
7 44.12 49.10 22 E 46.83 49.89
8 44.16 49.16 23 46.87 49.93
9 44.18 49.20 24 46.93 49.99
10 44.20 49.24 25 46.97 49.97
11 44.32 49.28
12 44.36 49.36 Chs A - E handset frequencies
13 44.40 49.40 are also used for baby room
14 44.46 49.46 monitors and low power
15 44.48 49.50 handie-talkies.

The old 10 channel models in the US operated on channel 16 thru 25.

The newer 900 Mhz cordless phone in the US operate from 902 - 928 Mhz

In the UK they use the following:

Channel Pairs Base Unit TX Mhz Handset Tx Mhz
1 A 1.642 47.45625
4 B 1.702 47.49375
2 A 1.662 47.46875
5 B 1.772 47.50625
3 A 1.682 47.48125

6 B 1.742 47.51875
4 A 1.702 47.49375
7 B 1.762 47.53125
5 A 1.722 47.50625
8 B 1.782 47.54375

10 Channel models Australia operate on:

Base Handset

30.075 39.775
30.100 39.800
30.125 39.825
30.150 39.850
30.175 39.875
30.200 39.900
30.225 39.925
30.250 39.950
30.275 39.975
30.300 40.000

5 Channel models Australia operate on:

Base Handset

1.725 40.025
1.740 40.075
1.755 40.125
1.770 40.175
1.785 40.225

In New Zealand the use the following:

It looks like someone did a really good forgery. Don't know why they
chose
you, maybe you upset someone.

The article had never arrived on any of our news servers, which is
consitent
with that type of forgery. The Path: line already contained our
servers, to
the server would have rejected it.

I can't really offer any more help than that. We keep news for 2 weeks
in
all groups but alt.binaries, so I went looking for the original post
myself.
Couldn't find it.

Hello,

You are not hearing a direct broadcast of shuttle transmissions. You are
hearing a NASA rebroadcast through amateur radio. There are several
sights set up around the country to rebroadcast all shuttle missions to
the public, thru amateur radio. The only exception is if the mission is
military in nature or is of a secret nature.

Andy

While is may be illegal where you are, it isn't here. In Australia, it isn't illegal to possess a CB linear, but it is to use one. Just like you can have a scanner that receives cellular but it's illegal to listen...

Nick.

Hi everybody !

Any UHF-Milsats recepcion reports from people in Europe ?

I wonder if FLTSATCOM 8 is still acitve and receivable here
in Europe (or in the eastern USA).

Would like to hear from people who received or still receiving
signals on that band. Especially I am interested in observed
types of modulation (as far as I know most of the comms are
in FM, but what about SSB which might be more efficient ?)
and the types of receivers and antennas used....

Unfortunately my RX is a little bit "deaf" in that frequency range ! :-)

Best 73 and good monitoring.....

Oscar, DJ0MY

It's engraved on the wood panel near the steam fitting.

> Can someone give me a list of all possible mods.

Send a request to: cell_mods@fcc.gov

> (please include instructions on how to solder)?

First, go to a science supply store. Buy the coiled solder ribbon they sell,
it's called Magnesium. Don't worry, that's just the brand name. It's really
solder.

Cut a 1" strip, hold one end in your hand. Touch the other end to the wires
you want to join. Bring your propane torch near the metal ribbon. The wires
will fuse. Voila! Keep a glass of water nearby in case of a few "sparks".

> Also, could someone send me a list of all the active frequencies in
> my area?

Everything YOU need to hear is on this frequency:

0.00006 MHz

Tune it in and see what's "buzzing".

> Finally, could someone tell me what, exactly, a "frequency' is
> (and keep it non-technical)?

OK, here you go:

Frequency is electricity jumping up and down over and over. It's
measured in pounds per acre.

Sorry if I left out any details.

>Please send all replies via FedEx overnight
> express--you pay shipping.

UPS OK? Here's my account number...

Thanks for that information. It is a capacitor/coil type. The capacitor
has an adjustment for tuning in on a frequency, and the coil
(stretched/compressed) for extending the range. It didn't address the
subject of drift. I'll try tweaking these to see if it will stabilize.

5469. Scanner OK to use on U.S. Air flights?

Newsgroup: rec.radio.scanner
Date: 1996-09-21 00:00:00 UTC
From: Radioman@localnet.com
Message-ID: <51vd3h$nko@prometheus.localnet.com>
Source record: 222494

Does anyone have any firsthand information on the use of scanners upon the U.S. Air airline flights. I have gathered from past postings that they are generally not allowed to be in operation during take-off or landing but that SOME airlines do allow them for the remainder of the flight and that this is further left up to the captain of the plane. I am just curious if I'll have any chance of taking it on a flight to florida in a few months. Thanks for any help.
Regards, Raymond Miller, N2NJK

5471. BC3000 Power Questions

Newsgroup: rec.radio.scanner
Date: 1996-09-21 00:00:00 UTC
From: dber@tiac.com
Message-ID: <32434533.1081078@news.tiac.net>
Source record: 222496

(1) I have a spare battery for my BC3000XLT... can it be charged without being in the main unit? Manual *seems* to indicate that it should be in the unit when charging.

(2) Can a different wall adapter be used for the charging/power to the BC3000 unit? Supplied adapter is 200mA 12V. Could I use a 300mA 12V adapter (assuming correct tip polarity)? The tip of the Uniden plug looks quite standard.

(3) Can the adapter/charger be connected for long periods of time if I want to use it in "base" mode (where I may not take it out of the house for a few days)? Is that bad for the battery (I would assume so since it's Nicads - unless the unit can stop charging automatically)?

Thanks much in advance and take care,

Dave Bernazzani

5479. What the big PRO-2006 Deal?

Newsgroup: rec.radio.scanner
Date: 1996-09-21 00:00:00 UTC
From: georgef@prolog.net
Message-ID: <51vnbj$4p5@news2.ptd.net>
Source record: 222504

I see someone is all excited about PRO-2006 Scanners. I own a PRO-2006 and don't see anything special with it, except the ability to listen to Cell Calls. Other than that, it is an OverRated scanner. Unless there is a mod to increase the speed. Don't get me wrong, I like the 2006, but I'd much rather have one of the new 1000 channel Radio Shed scanners 1)for more channel storage, 2)Much Faster Speed. If Cellular is what you're into, you can even buy a new CPU chip to replace the stock one in the new R/S scanners that will allow full coverage.

I just don't know what the 2006 hype is all about, I got one, but would trade for a 2035 any day.

How would you "know" that?

>I would be grateful to anyone who can tell me which diode it is.

I used to know....back when I had my PRO-2002, but it could have been
an "add-a-diode" hack, for all I remember.

> I know that it's readily visible when the bottom case is removed
> because I did it for a couple of customers when I worked for Radio Shack.

That's astounding! But sure enough, it is possible to get 800 MHz to
appear in the flourescent display. It is not possible to receive 800
MHz, nor anything else above 512 MHz. That's where the RF circuits
stop. There are no 800 MHz circuits in the receiver.

The same old myth went around about the PRO-2021 and the PRO-32, too.
It was possible to get 800 MHz in the display, but reception was not
possible because there are no 800 MHz RF circuits in those receivers,
either.

On the other hand, it is possible to recover the 380-420 MHz sub-band
in the PRO-2002, and receive it, too! That's done by an "add-a-diode"
or "clip-a-diode", but I don't remember which.

Fine. When you get attacked by a robber/mugger/other waste of life,
don't say I didn't tell you so. You will then wish you had a little 9mm
Beretta or similar in your pocket to defend yourself with.

> With your laws that allow easy access to guns,
>children are dying every day down there from drive by shootings. It
>makes me sick.

That's right. If the guns were illegal, I'm SURE the criminals wouldn't
possess them, right?

>No wonder we're the best country to live in and you
>guys are not even in the top 10!

But we're the #1 destination for Canadian snowbirds in the wintertime.
Guess there must be something they like here in order to drag their 30-
foot RVs all the way down to Florida every winter.

BTW, while they're here, they also make extensive use of our health care
facilities to have their neccessary surgeries performed. If your
socialistic health care system is so great, why do they PAY hundreds and
even thousands of dollars to have their operations perrformed in our
hospitals with our doctors?

We learned about 10 days ago of a proposed new law in the State of Washington that would have required certification of all mobile radio installations by the State Patrol. We contacted the State Patrol and our state representative, Brian Thomas. As a result, the proposed draft has been thrown out and the scheduled public hearing on the matter has been cancelled. Today the State Patrol has advised us of new wording for the proposed rule - wording that no longer appears to have an impact on Amateur Radio operations. You can read the complete story in an EXCLUSIVE story published at Ham Radio Online at http://www.hamradio-online.com

You can be sure that if the FCC comes knocking on your door, they have already monitored your transmissions. If the signal is substantially stronger than 4 watts through whatever antennae is on your roof should be, then they could prudently assume that you are using illegal power. If they "request" to inspect your station and find an 11 meter capable linear (or other illegal equipment), they will cite you and probably seize the illegal/illegally modified equipment. They are not concerned with ownership, only possession. They will have pretty much determined in advance that you have been using it.

It does. There are some blocked freq's, I'm not sure where.. 870-890 (Cell phones) and some UHF TV Audio??? The 9000 is IMHO a kick butt scanner.. VERY nice. VFO is Variable Frequency Oscillater. Similiar to a dial on a FM radio (older dial) can move through freq's or channels like FM radio.. Alpha Display is just that. 14 charachters!! Instead of 482.6125, you can display Palo Alto Police Ch 1(err.. is that too many?). Plus, PL is available! VERY nice scanner..

writes:
>
Sorry fellah:

It occurred as given. Just long ago. I posted when
this occurred and in what city and stuff like that.
The Press had a field day with it. It was in the
Oakland city Cable....first cable company and they
got this law passed.

Eventually I'll find the material and report back.
But seeing as how no one is paying me to research
the facts I have to rely on reporters in both media
who were around at that time...and talk to them when
I see them on the street when in the aforementioned
city....or in theBay ARea....

Many people were outraged and most media just treated
it as "FLUFF" story....no beeg ting brah.

Your conclusions are false and your insinuations
both uninformed and "hey, you didn't live here when
it went down"....

I may even have saved newspaper clippings on it. The
Bay Guardian (they have www site) ran an editorial on
it and they outdid the larger dailies on what they found
out. I think Oakland is run now by TCI Cable...there have
been four buy-outs of this cable company since this story
and law passed.

Mellow out fool. In time the facts will surface.
Put your ditty thing back in your holster and zip
your "zapped" lip. Give it a chance. You send
me 100 bucks and i'lll do it next week. It will
occur.

From: Miro.Ivankovic@guest.arnes.si
Message-ID: <LIL5/GFgJiMP@stenar.arnes.si>
Source record: 222525

Hello,

Can anyone suggest some proven VHF/UHF antennas for the
ar8000 scanner:

1. VHF/UHF (162MHz/433Mhz) flexible (handheld)
2. VHF/UHF mobile (magnetic?)

However, both should be an improvement on the airbands over
the one supplied with ar8000. Would be better to find out a
special VHF (need 119Mhz and 128Mhz) Airband whip?
If i missed something, please tell me.

Thank you very much for the help and any information!

>has 10).

It has them. But they're odd to program (the limits are programmed in
memory locations 400-401, 402-403, etc. And you must set the modulation
and freq step manually outside of Europe.

>The R1 also seems to have a more convenient keypad (normal

The Welz is made of heavy gauge plastic and has a solid feel. Wouldn't
worry about durability.

: poor voice reception makes it almost unbearable. Only noticed with a
: Pro-2026; not a problem on the others.

Probably intermod from paging systems. Too many 800 capable scanner
have this problem. A strong signal from any source will wreak havok on
the 800 Mhz sections.
Manufacturese have corrected this by adding a third stage of
conversion on high-end 800 capable scanners.

My PRO-66 and BC-855 XL all suffer from this problem.

I listen to the mobile inputs to Columbus Police and _rarely_ hear any
legitimate MDT transmissions. Most transmissions by the mobile units are
very short. I keep my squelch turned up all the way. I've found this
not to be a problem, as the car is either in range or it is not.

Most likely your scanner gets overloaded when you use the
external antenna. I have not played with Yupiterus myself,
but they are known to be very sensitive radios which unfortunately
also means sensitive to overloading and intermod.
If you are living near a FM transmitter a FM trap filter may
improve reception.
However certain handheld scanners are really not made for
use with effective outdoor antennas in RF dense areas.
If you know someone with a more RF robust scanner such as BC-3000XLT
you might borrow this and test in on your antenna.

I have also heard AF1 in the 240-400 MHz range. I have only heard it scramble once, but I have also never heard anything important. I'm sure anything important is scrambled.

When the President is onboard it identifies as "Air Force One," when a VIP other than the president is onboard it is usually identified as "Executive One Foxtrot."

If no VIP's are onboard it will ID as "SAM TWO SEVEN THOUSAND."

At least that's what I've read over the years.

Here's a little did-ya-know:

When Richard Nixon resigned, his resignation was to officially take place some time after his announcement. He was in Air Force One when the resignation was put into effect, and the pilot had to change ID's in midair, because since the President was no longer onboard, the plane was no longer AF1.

This could all be urban legend though.

Right On!!!!!

I also have read these childish posts by what I had assumed were adult persons. This is a public forum, and I am sure the majority of readers could care less about these petty personal feuds. If the combatants wish to continue their little war, maybe they could use E-mail instead of this forum. I, for one, could do without all this meaningless dribble...

If this is true--that these "village people" are sucking each other's monkeys--then someone should contact the Society for the Prevention of Cruelty to Animals. Or maybe People for the Ethical Treatment of Animals. I've heard about this monkey-sucking, and IT HAS TO END, DAMNIT! Dogs, cats, monkeys--they're all entitled to humane treatment.

Plus, wouldn't this be a dangerous practice for the human, as well? Wouldn't sucking on a monkey piss it off, and maybe make it attack?

I'll never understand how some people get their pleasure . . .

The battery strength _could_ be the cause of your frequency drift. More likely, it's probably the device drifting. You didn't say if it was crystal controlled or used a coil/capacitor combination. With such a rapid drift, I'd say you had the coil/capacitor type. Check the parts in the frequency determining part of the circuit. You might have to change one or two of them to reduce the drift to acceptable limits. Otherwise, you might try crystal control.

Negative. Headers are placed by the software, quite apart from the
message text.

>In trn, which is
>what I use, it passes the entire thing to Pico (or emacs, depending on
>what mood I'm in) with lines for Newsgroups, Summary, Expires,

Hmmmmmmm. Well, I suppose the software *could* allow you to enter
your own headers. I tried it above by changing my Organization: line
and adding a Reply-To: line. We'll see how it comes out once it goes
through the server. I don't think my software allows header stuff to
be put in the body of the message.

>So yes, you can alter the headers in the 'body of the message', as it
>were.. Ron is right.

Well, let's see if it's software-dependent. Check the header and
first two lines of this post.

>Now, back to scanning.. (*please*..)

It kind of is. I mean Katz or somebody in Katz's name offered to
peddle linears which can be heard by scanners.

Time-honored and field proven for several years; recently upgraded:

MOD-44B DATA/TONE SQUELCH: Lets scanner resume SCAN or SEARCH after stopping on continuous tones, computer data, and many other non-voice signals. Scan/Search stops are only momentary. Resume is automatic! Yet, indefinitely pauses for voice signals as it should! Works with and similar to the factory Sound Squelch function.

Scanners Supported: PRO-2004/5/6 and PRO-2035/2042

Complexity: Medium Easy. 2 ICs, 1 trimmer, several diodes, resistors, and capacitors. 5 connections to scanner, with one wire cut and two splices.

Available in six different ways.

1. Instruction Set Only - you build/install it.
2. Kit of Essential Parts plus (1) above:
3. Kit, same as #2 with a precut/sized perfboard:
4. Kit, same as #2 with a printed circuit board:
5. Same as (4), but assembled & tested. U-install:
6. Same as (5), but we install & provide misc parts:

NOTE: Instruction Sets run 6-8 pages and are very detailed with parts lists, diagrams, schematics, and step-by-step guidance.

Items 2-5 do not include switches, IC sockets, LEDs, or aesthetic items. An SPST switch is needed to turn the Data/Tone Squelch on and off. Switches and other personal taste items must be supplied by customer, although we do provide a basic toggle switch on rear of scanner for Item 6. The Data/Tone Squelch is extensively field tested; and time honored; - a quality modification.

Costs are not discussed here but will be provided upon e-mail request.

It's probably cross-modulation from paging and cellular systems.
When I was in a more urban area, I'd pass occassionally near this
transmitting tower that sent out pager signals, cellular transmissions,
and probably other data transmission as well, all on different 800-900Mhz
frequencies, and every time time I went near it, my PRO-51 could barely
receive the local PD's trunked system and would instead pick up those
signals, even though I wasn't tuned in to those freqs. It happens to a
lot of lower-priced 800-capable scanners.

If the problem is serious, the only thing I can recommend is
either move the scanner away from any cell/paging towers that you know of
nearby, or get a scanner that has triple conversion to filter all of that
out.

Do an Alta-Vista search for a company called Agrelo Engineering
(I think it is engineering, better just search for transmitters,
Agrelo) . From the pictures on their web site, they have some nice
surface mount, small and powerful transmitters and I believe they are
crystalled for around 160Mhz.
Prices are around $60-$129 assembled.

Don't we, as the consumers with all the money in the world
(collectively), have the right to say what we desire in a Scanning
reciever? What we say and what we purchase should drive the market.

We want:
Full range capable .5 khz to 2.0 ghz or higher (+)
All Mode
Multiple ant. connectors w/automatic switch
Serial interface (High Speed)
CTCSS,DCS,LTR,DTMF,ACARS,POCSAG,WEFAX,and so on ... capable (+)
Scan by PL Tone
Programmable Attenuation
Fast!
Alphanumeric Display
Multi-level Priorities
Multi-level Delay
Digital ready and upgradable (+)
Hundreds of channels Unlimited banking Upgradable Memory
Multi-level Lockouts (Birdies,Temp,Timed,Permanent)
Sound Card Integrated Software controled audio recording w/DSP (+)
External contacts,controls,and interfaces,oh my!!!
more,more,more
Most features work without a PC!!!!

(+) [might be a fight to get]

We want it all and we are willing to pay for it!!!

A modular Scanner with multiple options/boards/software versions.
Buy what options you want,need, or can afford.
Let's tell them what we want! Let our purchasing power dictate
features,functions and capabilities.

What do you say?

What else do you want? Built-in HOKA CODE 3? Tell them and prepare
yourself for the hobby to keep up with technology and $$$!

(+) [might be a fight to get]

We want it all and we are willing to pay for it!!!

A modular Scanner with multiple options/boards/software versions.
Buy what options you want,need, or can afford.

Let's tell them what we want! Let our purchasing power dictate

With all due respect, Dave; you've never seen the bureaucracy of the people's Democratic Republic of Washington in action! It is no wonder that everyone who read this stuff feared the worst. The troopers themselves are great. The civilian adminstrators and politicians her are capable of ANYTHING, and outlawing radar detectors, scanners and anything as WASPish as ham radio trasceivers would make perfect sense to those on THIS side of the mountains. Cell phone users and I am occaisionally one) can be a pain and hazard, but the rest of teh stuff is uncomfortably close to what we imagine not a few of our politicos would regard as good common sense. Remember: no man's life, liberty or property are safe while Nita Rinehart is in the Legislature! :)

5564. AR2700 DS 2700 Descrambler

Newsgroup: rec.radio.scanner
Date: 1996-09-22 00:00:00 UTC
From: sparkfel@primenet.com
Message-ID: <324625b2.4624630@news.primenet.com>
Source record: 222289

I ordered the DS2700 descrambler board from EEB last week and received it from them in two days, normal shipping. Good work from the people at EEB. They know product and ship promptly.

Installation is pretty simple, but the supplied instructions are wrong. Fortunately the correct installation procedure is available on the Official AR2700 Web Page. The only problem is that they leave out one important initialization step. When you select "SS On" during initialization you must then hit the enter key before powering the system down. This will "set" the SS option for use later. I know most people are aware that the enter key must be pressed to do this, but it is not stated and it took me two or three tries to figure it out on my own.

Fortunately I own a cordless phone with audio inversion scrambling so test-out was a snap. I'm happy to report that the unit works well. It induces a small squeal into the audio when in operation, but it is liveable. I have no idea if this is common in audio inversion descramblers (the kits) found on the market, but I assume it is. Since most kits run $50 or so, the small extra cost of the internal descrambler card is well worth it, since it requires no assembly, makes one less box to carry around, and provide power for.

Now I need to find software that supports the descrambler mode. Does anyone know of any? I think ScanCat Gold provides an option for custom programming, but I really don't like that software, especially 'cause it's DOS based. Plus I have no idea if the AR2700 has control codes for descrambling via an interface. Can anyone provide an answer?

Thanks and 73,

Mark

Already done this, 30ch / sec. is still slow when compaired to 50cps as the
PRO2035 or 100cps as for the PRO2036.

>
>>Don't get me wrong, I like the 2006, but I'd much rather have one
>> of the new 1000 channel Radio Shed scanners 1)for more channel storage,

I'll just take for ever to scan a 100 or so channels. (see below)

>
>> 2)Much Faster Speed.
>
>Talk about overrated. Speed is. A Volkswagen beetle and a Ferarri
>will make it across town in about the same time. If your scanning is
>in a congested metro area where there are lots of signals, then speed
>is not an important issue.
This is only true if your listening mostly involves Fire/Police/Utilities
etc. But I enjoy listening more to Mil Air, Secret Service, Satellites where
I need to scann alot of channels fast inorder to 1)find new freqs. 2)just to
catch something on an air-air refueling freq or NORAD freq or the Shuttle/MIR
downlinks. Don't get me wrong I too enjoy listeing to Fire/Police and that
is what I use my 2006 for alot. But my PRO-60 with has faster scan/search
rates is better for the majority of my listening. Cellular is fine too, but
I don't use that much so why sacrifice a better scanner for a band that I
might scan an hour every week? I'd rather buy one of these 900MHz - 400MHz
converters and add it to a PRO2035 or any of the newer 1000 channel scanners.

>Now THAT is overrated. A European CPU for the PRO-2035/2042 will
>definitely address the cellular bands.....but will NOT step at our
>30-kHz increments; instead, the step is at 12.5 kHz, a decided
>disadvantage.
If I set my 2006 to 12.5KHz steps, I still can get a lot of cellualr calls. I
agree 30khz would be better, but again a scacrifice for some I only use a

little.

>
>And then there is the BIG question: does the European CPU address the
>VHF-Lo band of 30-50 MHz? It is illegal in Europe to monitor 30-50MHz.

Well I learned something, so the European CPU's cant cover 30-50? That is a
band I can't live without (But I can live without Cellular)

>
>
>Have YOU ever replaced a 100-pin surface mount CPU that occupies an
>area of less than 1 square inch?
>
You can buy the whole PC board that contains the CPU (yes more money, but
isn't that what cell is all about? MONEY....Rich people playing with phones
in their car, or Gov't Officials makeing STUPID Laws that will just take more
money away from the working public? ---steping off my soap box---sorry.

>>I just don't know what the 2006 hype is all about,

has anyone traveled domestically (US) or Internationally with electronic equipement and experienced any security delays related to the toys you were traveling with.

I usually travel with a shortwave radio (SONY-2010), I also take along a hand held scanner (either Regency HX-1000 or AOR-1000) to listen to the action in the air and around where I'm going.

I have been able to give everyone a heads up on glight delays based on what I was hearing on my scanner..either weather, mechanical, or ATC flow control delays.

also, when I am driving, the scanner gives me real-time road information. If I hear a police or fire dispatch or a chase on the scanner, I know to plan for an altenate route. Beside police and fire, I can scan all the radio traffic reports they commonly use frequencies in the 450-451mhz area Airline operations frequencies are usually in the 128.0-132.0 mhz(AM) and 460.6-461 mhz (NFM) area. At some airports, a trunked 800mhz system operated by ARINC may also be in use.

In Germany, I did have a brief delay..they wanted to know how the SONY-2010 worked. I explained...they also used a sniffer to check for anyh traces of nitrates (explosives) I did have aproblem with the scanner that I had in a pouch on my belt...Airport security (Police) wanted to know what i was doing with the scanner. I showed them my frequency lists..all were for Police, fire, and aviation frequencies in either Arizona or Southern California.....Finally, I was able to get the scannerhome by letting the plane's captian agree to carry it in a special pouch.

I am considering purchasing a Radio Shack Pro-26, but I am unsure whether it will be significantly better than my Pro-51. The Pro-51 is an excellent scanner with good sensitivity. However, I find it is subject to cellular phone interference when I scan the police trunking channels (866-868). The Pro-26 literature says it has "triple conversion" and "switchable attenuator", but I don't know what they means (and whether it will address the cellular interference I want to avoid). If anyone has a quick description of what these features mean, or any experience with the Pro-26, I would appreciate hearing from you.

Aren't we being a little too literal? Thier company can offer the warranty as did Grove, EEB and others. It is a damn good radio... I have two and would buy more if I could justify it (wife and all). Coupled with the OS456 a good ant. and Scan*Star for Windows Software it is hard to beat for the expense.

The 2006 is no antique. Production stopped 2 years ago distribution
only 6 months ago. The 2042 or the 2035 haven't added any more (for the
most part, much less) than a 2006 with a few inexpensive MODS. Get the
OS456 and fly at 65cps or use Scan*Star for Windows and 2 2006's and
scan at 65cps and receive at the same time!!!

I requested this mod in this very newsgroup about two years ago, and someone was kind enough to pass it along. It seems to have since disappeared, and I lost my copy. So... just to be nice, I pulled my Pro-2032 back apart.

Here's what you do:

Remove the bottom cover from the unit. Set it so that the volume & squelch knobs are to the top & left. In the upper left hand corner of the circuit board you'll see a metal shield measuring 1 and 11/16" by 4 and 1/16". Heat the solder connections holding this to the board and remove it. About midway between the two larger chips and down a bit, you'll see a very small, black, rectangular, three-legged diode. One leg extends out to the left, two out to the right. CAREFULLY disconnect the upper right leg of the diode, in a manner of your own choosing.

You're done. Put the shield & cover back on. You'll now get continuous coverage between 806-960MHz. The two unblocked spectrums (824.040MHz-848.970MHz & 869.040MHz-893.970MHz) are spaced in 30kHz steps.

If you screw anything up, I don't wanna hear about it. It worked great on mine!

Ezra

Mike--Thanks for the help! Looking forward to trying that
"magnesium" solder. And you're right: took a look near the
steam fitting and there was the model number, just like
you said! By the way, why exactly do they call it a "scanner?"
Can you use it to scan those bar codes they've got on all
the stuff over at Ed's Shop 'n Save? Just wondering . . .

5593. Which Scanner?

Hello I interested in buying my first scanner. I want a good one but I will not pay more than about $250 (U.S.) What scanner should I buy and why? By the way I want to listen to aircraft, police, ambulance and local transit frequences. I also want a base scanner. Also I'm buying a new, not used, model.

Please e-mail me at chand@idirect.com

Here is my opinion to your question, I also have a discone (Radio Shack)
hooked up to "plenty" of RG-8 coax. Its mounted about 35ft in the air
outside of the house. I pick up plenty of signals from the mountains all
the way south & along the front range. BUT, it also depends ALOT on
conditions (propagation). I too was always looking for the distant
signal. You can't always get what u want, but sometimes it pays off.
Mount that sucker outside(you didn't mention if yours was) if the local
codes allow you to. It takes some time & some work on the listeners
part. Have fun!

5595. Does the LAFD use two-way radios or walkie talkies?

Newsgroup: rec.radio.scanner
Date: 1996-09-22 00:00:00 UTC
From: michaeled@earthlink.net
Message-ID: <523n3p$4ov@uruguay.earthlink.net>
Source record: 222332

Does anyone know the frequencies used by the Los Angeles Fire Department after they arrive on scene while talking to one another in the trucks and engines.

Are they using two-way radios or walkie-talkies? The reason I am asking is a Light Force was dispatched to my apartment building and after the EMS were inside I heard them talking to the engine thru the loud speaker. But I had nothing on my scanner.

Thanx in advance for any help in the matter. I feel it is the last piece of the puzzle for monitoring the LAFD.

Good scanning makes good friends,

Mike

> band antenna?

Duhhhhh Uhhhhh Nope!

I can't help but to detect sarcasm but I will continue.
Does your (1) ant. cover .5khz thru 2ghz with no large gaps in gain?
Are you saying that 1 full range ant. is better than 3 ant. each made for a specific band or range. Perhaps this freq. requires the omni and the other the beam.
Automatic... Let the radio choose the best ant. for the freq. (job)!!!
>
> >Serial interface (High Speed)

Don't forget that the discone is a "zero gain" antenna its gain rating will be 0 dbi or -3 dbd. If yours is like most of the VHF/UHF discones (I have a Diamond), it covers approximately 25 MHZ to 2 GHZ, but with no gain at all. That means that a dipole will have significantly more gain (3 db) at its resonant frequency than a discone.

Discones have two principle advantages, in my opinion. First, they exhibit a relatively flat gain (-3 dbd) across their entire frequency range. That means that you'll not need to install several antennas to receive across a wide range of frequencies.

Second, they have friendly physical characteristics. It is relatively easy to install a discone in a location where it has maximum height - like the top of my tower. Not a lot of weight or windload, so it's pretty easy to move around. They're also pretty rugged when it comes to ice/wind survival.

Of course, the big trade-off is gain. Altitude can offset some loss of gain, but ultimately, the discone is inferior to any true resonant antenna. That's where you'll have to make your decision.

Regards,
Charlie

>
Yes, at $349 for 200 channels it's a bit much. I found one at a hamfest for $299 about a week after they started showing up in the stores. I intend to keep it, although it is still kind of expensive for a 200 channel scanner, it is an excellent radio. The CTCSS board appears to be the same one that's in the 9000 and it works great too. By far, this is the best of the bunch of RS 200 channel base line (which is a crowded spot :)). It is also the most expensive.

If you were looking for something and don't want computer control, this might be a good option. It'll be on sale again, I'm sure. Otherwise, I'd see if I could find a 2035 on clearance and put an optoscan unit in it.

???

Are you referring to US Cellular ?

The "UK" PRO-26 (RS 20-9506) has full coverage. The only difference between
the US PRO-26 (20-506) and the ones we have is that they use a different
main CPU which in the UK version allows full 25-1300MHz coverage.

The only way to modify the PRO-26 in North America to allow US cellular
frequencies to be keyed in is replace the CPU fitted with the UK one.

Which modification have you seen that only applies to the UK one ?

It is also possible to force the PRO-26 to "receive" US Cellular frequencies
the the 300MHz area although. I think you will find details on the web, try

>>> of the new 1000 channel Radio Shed scanners 1)for more channel storage,
>>

George,

I don't want to get involved in the on-going debate between you and
Bill, I'd just like to add my two cents...

The 2006 (and 2004) , at the time of release were the state of the
art. Bang for the buck was the best there had ever been, especially
if you took into consideration the mods that could be done. As time
went on, it also became clear that this would be the last versatile
radio to be cell-restorable.

Most folks do, in fact, listen primarily to Public Service, where
there is so much activety that speed becomes mute. Your interests are
slightly different, therefore speed is an issue. But again, at time
of release, the 2006 WAS fast.

Just as in computers, technology moves forward, and that is beneficial
for someone like you that has different wants. For myself, I'm so
happy I got my 2006 (last one to be had in 3 counties), I could just
sh**. I'll never give it up, and will gladly get another if the right
opportunity comes along. I also archive every bit of info on mods,
etc. I can find, as this is arguably the best-supported radio OF ANY
TYPE ever made. The same cannot be said for the current radios you
are interested in.

Mark

The truth as I perceive it to be.
Your perception will be different.

"OH GEE Mr Cableguy, I'm REAL sorry I put three bullets in your chest when you came thru that door without warning or warrant. I was truly `in fear of my life' because you had this strange looking metal object in your hands that I really thought was a gun! You know how bad crime is in some areas now!"

I would not nor am I advocating anyone else to use deadly force in defense of property alone. A person is reasonable justified in the use of deadly force to protect themselves or another from attack when they "REASONABILY" believe they are in IMMEDIATE DANGER of attack that will cause great bodily injury or death. You do not have to be in immediate threat, you need only reasonabily believe you are in immediate threat. Remember these words: "Your honor, I was in immediate fear of my life and the lives of my family."

ANY governmental invasion of constitutionally protected areas REQUIRES a warrant issued from proper authority and on swore affidivit listing the probable cause to believe that (a) a crime has or is being committed, (b) the location and things to be searched, AND (c) the items to be siezed. This applies even to a private individual or comapny acting on behalf or at the request of ANY governmental offical or agency. A company acting with reliance on such a criminal statute would be considered to be acting as the agent of the government and a warrant would be required.

NO CABLE COMPANY with half a legal department is going to risk a multi-million dollar lawsuit for the sake of a monthly cable bill. NO CALBE EMPLOYEE I've ever met is willing to risk his life and personal property for his company. Geez, most of them are afraid of getting bit by the Scottish Terrier in the backyard.

>pouch.

I've been through security in Chicago and Minneapolis many times and not once did I have a problem with my toys. Once I had an alarm clock in my carry-on and they wanted to look at it, but no big deal. However, at airports here in Canada, I've almost had to be strip-searched
each time I bring a toy through security. Had to show the shortwave radio worked, had to dial up ATIS on the scanner, had to make a cellular phone call, play a tape, all to the amusement
of passing passengers! And this is at a very small airport. Grrrr. But not as serious as your encounter in Germany.

Here is a list of freq's someone sent me back in '91. Some of them were used in the NJ/NY area, so give them a try to see if they are used in your monitoring area.

I monitored 345.500 in use this week for AF1. Try NFM, WFM, AM modes to see which gives you the clearest signal. I've heard multiple channels on one freq, just like sidebands, but you can tune into most of the conversation.

ALPHA BRAVO list:
246.950 RF-02 uplink
RF-07 downlink
305.550 RF-02 downlink
RF-07 uplink
322.750 RF-04 uplink
RF-09 downlink
326.000 RF-01 uplink
RF-06 downlink
336.800 RF-03 downlink
RF-08 uplink
345.500 RF-03 uplink
RF-08 downlink
366.000 RF-04 downlink
RF-09 uplink
382.350 RF-01 downlink
RF-06 uplink
390.000 RF-05 uplink
RF-10 downlink
397.050 RF-05 downlink
RF-10 uplink

This is how the original list is written, I've never heard more than 2 freq's in use and may have heard a third but the signal was very poor.

Mr. Perot's code name is Third Place Again. Most comm has been clr voice so far. Lots of activity in NJ and NY.

Regards,
LGS

Source record: 222353

Hi Russ, while I can't comment on the RS item, I do have a Jim M-75 pre-amp and it works very well.

Since it also can select bands you wish to get extra gain on, 225-1500, 108-185 and 24-2150MHz, it does a good job of attenuating the siganls outside those bands. (-10 to +20dB gain)

Very effective on VHF and UHF, especially those low power, unlicensed surveillance freq's that some towns use. And it does a good job on the 800 meg band for whatever you may want to monitor in that band.

Current I see ads for $119 on the Jim M-75. There is a M-51 available too but I've never used it, it's a bit smaller. One review in US Scanner News found it to be a very good amp also.

Both are portable but they will work nicely with you base antennas. Hope this helps some.

Regards,
LGS

These antenna's are fine... If you want to kill your reception. I had one and it was its reception was terrible. It worked a little better when I opened my door. Only one problem, you can't drive down the road with the door open.

I recently found an old gutter mount CB antenna in the closet. I cut the screw mount plug of and put a BNC plug on it. Now I'm getting stations I couldn't get before with my Pro-2036.

You ever been inside of it? You ever study the schematic diagram?

> except the ability to listen to Cell Calls.

Unrestricted coverage of 760-1300 MHz *is* a plus.

> Other than that, it is an OverRated scanner.

How? Where? What "rating" is overdone? Please elaborate.

> Unless there is a mod to increase the speed.

That can be done. Clip BOTH diodes behind the #3 key of the keyboard,
inside the front panel. One restores cellular. The other gives a
speed boost to 30 ch/sec. Modest, but definite.

Not particularly recommended, but you can swap CX-501 with a 14 MHz
quartz microprocessor crystal for another speed up. 16 MHz and even
18 MHz are possible, but I have seen CPU's blow at 18 MHz. So 16 MHz
is risky.

>Don't get me wrong, I like the 2006, but I'd much rather have one
> of the new 1000 channel Radio Shed scanners 1)for more channel storage,

The PRO-2006 is capable of 25,600+ channels. Time honored and field
proven, too.

> 2)Much Faster Speed.

Talk about overrated. Speed is. A Volkswagen beetle and a Ferarri
will make it across town in about the same time. If your scanning is
in a congested metro area where there are lots of signals, then speed
is not an important issue.

> If Cellular is what you're into, you can even buy a new CPU chip
> to replace the stock one in the new R/S scanners that will allow
> full coverage.

Now THAT is overrated. A European CPU for the PRO-2035/2042 will
definitely address the cellular bands.....but will NOT step at our
30-kHz increments; instead, the step is at 12.5 kHz, a decided

disadvantage.

And then there is the BIG question: does the European CPU address the VHF-Lo band of 30-50 MHz? It is illegal in Europe to monitor 30-50MHz.

Have YOU ever replaced a 100-pin surface mount CPU that occupies an area of less than 1 square inch?

>I just don't know what the 2006 hype is all about,

Where exactly do you see this "hype"?

> I got one, but would trade for a 2035 any day.

Well, more power to ya. Diversity is what makes the world spin.

But so far, I haven't seen you make a case against the PRO-2006. You spoke of "hype". Where is it? You spoke of speed. But speed really isn't a major issue. Talk about "hype"....you overplayed the need for speed. You complained of "channels", but the PRO-2006 is readily capable of 25,600 programmable channels in 64 Blocks of 400-ch each, with all the acoutrements per Block retained: 10 Banks, 10 Monitor channels, etc. So that makes for 640 different Banks of 40-ch per Bank; 640 Monitor channels; 64 Priority channels.

There is no limit, either. If 64 Blocks of 400-ch each isn't enough, then how about 53,200 channels in 128 Blocks? Even 106,400 channels in 256 Blocks.

And......only about 20-40 other potent mods are possible, too.

Please explain your views, if you will. Your reasoning, thus far, escapes me. Play like I'm dense and elaaborate on your views to me.

Negative! :-) The test headers that I added appear in the text; not
in the actual header data. When you hit "reply to" to answer the
post, header data is not copied into the reply and quoted. But what I
added as the first two lines of text in the form of header data still
gets quoted in the reply-to. That indicates they are not real
headers.

Above is the real header of my post....

>Organization: Scanner Hill
>Reply-To: 74107.1176@compuserve.com

See? These appear in the text portion. Not real header data!
I think the other cat was right about HIM being able to do it. If you
use a UNIX shell or some other Unix editor, I'd guess you could enter

your own header data. But the header ends with a blank line, and then anything added after that, even if it appears like header data will be interpreted by the software as text - not header data.

I developed the procedure for calibrating and adjusting X-301 in the PRO-2004/5/6 scanners. I wrote the procedure in exacting detail. It was submitted for extensive beta testing before I first published it SEVERAL YEARS AGO!! Then and only then was it published. I reposted it HERE as a service to the community. The article speaks for itself and stands on its merits - with testimonials of one after another who performed the procedure with success.

THAT is my "position paper". I will not write another, thank you.

It was subsequently attacked by unqualified and ill-informed people. This kind of thing will happen again and again. There is no solution for it, except at the reader's end. The reader has full and total control over what enters and resides in his computer. Not to mention what enters and resides in his brain.

Incidentally, virtually everything I publish....here or on hard copy is thoroughly tested before it is ever released.

Only problem is that the stores have to sell enough of the items to make a profit. Assume Radio Shack has 3000 company stores. Each RS must sell a couple a year for the outfit to make a buck. That's 6000 radios. The warehouse must have a backup or two for each store, so you now have 9000 radios per year. Uniden, of course, will sell a similar radio and they have similar constraints, so now you have 18,000 radios per year that must be sold in order for the company to come out ahead. (BTW, if they can't make a profit, they won't try to make 'em.) That is a lot of scanner buffs that need to shell out $1,000 or more for a radio. Considering there are only about 700 members of Scan-L, I find it hard to imagine that there are enough of us out there to allow us to buy 18,000 of them every year. The only force greater than the consumers' desire, is the need for the company to make a profit.

I agree that such a radio would be great, but the numbers just don't support it. Your idea of a basic radio that allows numerous options to be added is probably more feasable. It's like buying a car...do you want the stripped down version or do you want one with a sun-roof and a CD player?

As Forrest Gump would say, "...and that's all I have to say about that."

Andy

Funny you mentioned Grove's gizmo. I got one for the same reason and promptly peeked inside to see what makes it tick. I kinda expected to see something to provide some isolation from the AM/FM to the scanner, but I was sadly mistaken there. Besides one of the coax cable's shield not being soldered properly (it was broke off the pc board), I found a whole lot of solder flux on the board. When flux gets damp, it conducts, and would degrade its performance. And as far as isolation, what can you expect from one resistor and one cap. The thing does seem to work, but I have the parts around here to build a bushel of 'em for about $0.50 each.

The new Radio Shack Pro-2045, listed in the new catalog seems like a decent scanner, and I wonder why there's been no talk of it, pro or con..ANYWHERE.....

Yes, I know it's a scaled down version of the Uniden 9000, and at the list price, OVERPRICED!

BUT..with the Rat Shack's liberal 30 day try it for free policy...you would think some die hard scanner nuts would've taken advantage and checked one out......

Maybe I'll have to....

>reciever? What we say and what we purchase should drive the market.

Yes. Supply and demand. What we want, we buy. Let's look at what you "want" on your scanner as to what the new AOR has (The 3000? Or 1000? Forgot. the one that decodes DTMF & PL?)

>We want:
>Full range capable .5 khz to 2.0 ghz or higher (+)

Nothing above 956.000 in voice. You do know that, right (well, except for ham. But who listens to hams anyway?)

>All Mode

Found on most scanners. 3k has it.

>Multiple ant. connectors w/automatic switch

Why? Automatic switch? How? If you want multiple Antennas, you hypothetically need one for low band VHF (40-100 MHZ), one for air (118-130), VHF Commercial (150-174), UHF (450), T Band (512), 800 (800), 900 (900)... We're looking at 4+ antennas? Ever hear of a dual band antenna?

>Serial interface (High Speed)

Found on most new scanners. 9600 baud is as fast as they're gonna go.

>CTCSS,DCS,LTR,DTMF,ACARS,POCSAG,WEFAX,and so on ... capable (+)

POCSAG?? That's called an invasion of privacy in my book. I don't want YOU knowing who paged ME. Most newer scanners can decode PL. DCS isn't that used YET.

>Scan by PL Tone

What do you mean? Scan with PL?? The 8500 (BC) does that. So does the 3k

>Programmable Attenuation

3k, BC9000

>Fast!

BC9000, 3k

>Alphanumeric Display

BC9000.. the 3k doesn't.

>Multi-level Priorities
>Multi-level Delay
>Digital ready and upgradable (+)

>External contacts,controls,and interfaces,oh my!!!
>more,more,more
>Most features work without a PC!!!!
>---
>
>(+) [might be a fight to get]

Ok, the AOR 3k has MOST of the above features, except the ones that NO scanner has yet. And it's about $2,000. So your scanner, we're looking $4,000++... Wow.

>We want it all and we are willing to pay for it!!!

Who's WE white man? =)

>A modular Scanner with multiple options/boards/software versions.
>Buy what options you want,need, or can afford.

Just got mine and I love it... The only problem is the included antennas.
If you are
using this as your main base scanner use an outdoor antenna even if hung
from
your ceiling (like mine) the reception will dramatically improve.

Good Luck

I don't sell them, but I designed a real motherhummer of an RF listening device and published it in a series of articles in recent back issues of the "World Scanner Report". If you can solder and round up parts, you can probably make it.

The cool thing is that is very, very good. Rock solid frequency of choice, and the detection sensitivity is so good it will pick up whispering in a room from 15-ft away.

You can FTP the Index to the World Scanner Report as well as its Table of Contents from my FTP site. That way you can peruse the titles and keyword index to see if the project might appeal to you.

Need a little help from all of the experts out there. I am planning to purchase a full range, hand held scanner. I need SSB and want to run it about 10 hours straight at work. It appears that there are only a few that would meet my needs. I havn't had the opportunity to see the AR8000, MVT-7100 or MVT 7200. These appear the only ones that meet my needs with SSB and AA ni-cads.

I also need a radio that will function well in a high noise (electrical) area. Are any of these suitable?

Can anyone comment on any of these radios? I appreciate the help.

>Wouldn't sucking on a monkey piss it off, and maybe make it
>attack?
>

I think the frequency that you can hear all this action on monkey sucking can be heard on 69.6900Mhz. I don't think that my 2026 will pick this up...it doesn't have a mode button for am/nfm/wfm/s&m.

You can pick up the 69.6900Mhz, though, by pressing 2-9-L/O. Be warned...this could clear your first ~30 channels. Don't worry about channel 23 being out of band since the scanner is date code 11A3, thus cell capable once L201 is removed!

Hi, My name is Dean and I've been a scanner fan for about 20 years. I have been inactive for awhile but want to get back to it. I also have the ability to run a mail list at no charge to me. I would like to get feed back from others who would be interested in being part of the list. The main focus would be federal, state and local law enforcement freqencies. I'm am a fan of surveillance listening and know there are others that are too. The List would not be limited to this but would be the main focus.

If this sounds good to you, please send by email the following:

Your Name
Your email address
The city you live in
Any ideas on what you would like the List to be and not be
Ideas for a name for the list

The list will not be moderated unless we feel it is necessary. Cheek type wars will instantly start moderation.

Well,what do you think? I will post this once a week for 4 weeks and see what happens. DO NOT post me too's to the newgroup!! Email me at :

djacobs@batech.com

I will post the results when the votes peter out.

Thanks for your time,

Dean

I've had a RS Pro-33 for the past 3 years and am finally thinking about upgrading to a better one. I am currently looking at the Pro-43,26 and any other ones that can be modified to receive cell freq.'s. I want the most for my money, but these models are so expensive brand new(for me anyway)and was wondering if anyone is selling something that would fit my needs or at least have any good recomendations. I would also be interested in other manufacturers, but don't know much about them.

Looking to spend no more than $225.

Many thanks in advance,

-Poria

Reverse engineering. Look at HOKA Code3 and what it can decode,
eventually all proprietary protocols just become protocols. They were
created for a means to an end.
Imagine three people, one created hardware to detect Motorola trunking
protocol, one created the software to decode it, and the last created
the reciever that brought it all together.

At that point the infringement is only by the consumer.

I buy the CD. I record the CD to cassette. I play the cassette in my
car. I make back-up copies of my software before I install it. Sometimes
I load the same software on my laptop as my desktop.

Build scanners like computers. Hell, build scanners from computers.
WinRadio is a start. Add a few cards, software and we have a upgradeable
scanner. Better components on better cards need to be created.

But then there must be some standard like pci ide isa eide vga.

Get the idea? If they build it we will come. At least we will get
excited.

> SMALL. We can't make any demands on them.
Yes we can, but we don't need to demand, just highly suggest. Tell them what we want, bombard them with email, snailmail, lists and suggestions. Customers drive the market with users groups. Here at rec.radio.scanner and other newsgroups affiliated with the radio interests are the areas that we can get the attention of the users to tell the marketing people that control the engineers.

WE THE SCANNISTS...

I propose that we start a users group to discuss what we want, what we expect and let US! drive the technology our direction. WE THE SCANNISTS should not be held back by mere trunking and digital protocols. Upgrade on the fly. We must not be held back by novice wisdom. Novices always want more knowledge and then they need to spend more money on all new equipment. This is a marketing ploy. KISS. Keep it Stupid Stupid. My business is the phone business, and they tend to manufacture and program to the lowest common denominator. BUT... Ther is always the upgrade and most of the time, if you have done your homework your system can grow with your requirements and your abilities to manage it. We need the chance to do our homework.

>>According to the information published in August Pop Comm there are 7
>>frequencies shared.
>>Is this information incorrect?

The frequencies are in the GMRS band...but no two frequencies are "shared" between the GMRS and the FRS. FRS frequencies are unique, and equipment transmitting on them must be FCC type-accepted for the FRS and the FRS only.

>>You can ordera soft case from RS thru th catalog for about $20.

The problem with "soft" cases is that...well, they're soft. Providing a
little bit of protection for scratches - but not for impacts.

If you want to seriously protect your PRO-43 investment, there is NO
better case than Howard's:
==========
FROM: Howard Bornstein
Design EQ
P.O. Box 1245
Menlo Park, CA 94025

I now have limited supplies of custom-designed, hand-made
leather cases for the Radio Shack PRO-39, PRO-43, and
PRO-44 handheld scanners.

The case is handmade out of fine, black, Corinthian leather
(ok, I'm kidding about the Corinthian part) and fits snugly
on the PRO-39/43/44. The case has cutouts for the display,
the keyboard, and the power ports. It also has sound
holes over the speaker.

The scanner slips into the case without having to put the
belt clip through a slot. The case is designed to stay on
the scanner all the time, so, to that end, there is a
velcroed flap at the bottom that allows you to open the
battery compartment and change the batteries without ever
having to take the case off. There are also slots in the
back of the case if you want to loop your belt through it
for greater security.

With a little "training" the scanner in the case will stand up
on end without any problem.

The cost of the case is $29.95 plus $2.00 S&H. If you're in
California, you'll need to add $2.47 state sales tax (sorry).
Since the cases are handmade, it may take as long as 3-4 weeks
from receipt of your check or money order. I will try to speed
this up as much as I can. The cases are sent out via airmail
and satisfaction is guaranteed.

To order, send a check or money order to:

Howard Bornstein
Design EQ
P.O. Box 1245

Menlo Park, CA 94025

You can reach me by phone at 415-328-9181 afternoons PST or via CompuServe Email (ID:76174,637.) If you are ordering from outside the US, please drop me email, because the postage will be a bit more. Feel free to contact me if you have other questions about the case, and thanks very much for your interest.

Regards,
Howard

Message-ID: <2ac_9609240040@stat.pubnix.net>
Source record: 222254

Hello mister Clough.

>The "UK" PRO-26 (RS 20-9506) has full coverage. The only
>difference between the US PRO-26 (20-506) and the ones we have is
>that they use a different main CPU which in the UK version allows
>full 25-1300MHz coverage.

I understand the PRO26 is a triple-conversion scanner: is it made
by GRE like all 3conv. RS scanners?

In Canada it's easy to make a postal money order in UK pound
currency: what is your price for a brand new PRO26 with US-cellular
capability? Same questions for the PRO60 and PRO2042.

You can reply by e-mail if you prefer. Thanks.

M.C.

After hearing a dispatch for a 415 disturbance the dispatcher informed the units responding that the subject is known to carry a "35mm handgun".

The two officers responding started talking to each other using simplex. They were making comments about the "33mm handgun".

"I wonder if it's a 24 or 36 round?"
"Think it's an automatic or a manual advance?"
"Probably has one hour developing"
"I forgot my photo proof vest!"

That's the toughest I've ever heard. You should not have had the
scanner on your belt. You're attracting too much attention and they're
right at getting suspicious. Keep a low profile and you'll get there
faster.

AP> hearing from you.
--
The triple conversion eliminates cell phone interference at around
866-868 MHz. The Pro-26 does have an image problem though in the air
band, if you ever have any intentions to listen there. I've come up
with a fix to reduce the interference, but it isn't easy to do, so
I haven't posted it, but if anyone is willing and interested to do
"micro" surgery in the 26's frontend, I'll post it.

The switchable attenuator will decrease sensitivity in selectable
channels, so it lessens the chance of interference from unwanted
transmissions, but the same thing also happens to the actual channel
that you are listening to. If the signal of the frequency you have
punched in is strong, and the interfering frequency is weak, then
the attenuation feature will work ok, if it is the other way around,
then it won't work.

Let's say that I have a set of Rabbit xmit/recievers. And, let's also say that they don't have a very good broadcast distance, one that can barely transmit a signal to the upstairs TV in a two story house. Now, is there a way that the output on this puppy could be boosted, for a better signal? Now of course, this is all hypothetical, but I was just wondering if there was a quick fix that would add MORE POWER (grunt grunt grunt) to this thing. If you have a mod I could theoretically do, or a pointer to this info, I'd greatly appreciate it. Tnx

>Options/General/User

Jack, don't be silly and/or argumentative until you know the
issue......which happens to be the question of altering or
adding header data *from text lines within the post*.

Your "Options/General/User" is not at issue. That method of
changing header data is obvious. At the same time, there
is only a limited amount of header data that can be changed
that way by the software setups.

But again, most software, especially Windows and DOS newsreaders,
do not recognize header data entered from the *text* of the post.
I *think* some UNIX editors may allow that, and perhaps even
require it, but I'm not sure on that. I don't do Unix.

: authorize possesion of equipment that might otherwise be prohibited. So
: yeah... an amateu license does give you persmission, so to speak, to own
: certain equipment."

Yes, you wrote it, but it is not true. Read about the part where possession of an amp by a CBer is "presumed" to be used illegally. Note the "and", it is critical to the section. Also note that there is no prohibition of ownership.

: But hey - you're right. The FCC won't ask you for the "pink slip" on
: your linear. However - if you are not a ham, it would be illegal to buy
: a CB amp since, without a type acceptance, it would be illegal to sell
: it. In a roundabout way, you CAN'T own one if you can't buy or build
: one. But that changes hen you have an appropriate license.

How about Ham amps? There is no prohibition against even a CBer owning or buying one - although many hams refuse to sell to someone without a license.

: So for the rest of you that want to post arguements. If you are
: inclined to write "own an amp" in a future post, please replace it with
: "possess an amp" ... then we can argue the points of the regs.

See above, and the regs. Make that "use an amp", or even "CBer presumed by FCC to have used an amp".

Bill

Bill, you should be warned that writing in simple accurate plain
English is taken to be unacceptable nit-picking in these newsgroups,
and likely to attract angry flames. And writing it in complete
sentences with correct puctuation will just add fuel to those flames.

There are _14_ channels allocated to FRS. Some radios though will
just carry 7. More than sufficient, especially the ones with the CTCSS
tone encoder/decoder capability.

When you increase the output of these devices by adding an amp you have
what many Hams use for amateur tv, and you must have a license to use
it. Or in other words... yes it can be done.

I can't say I've undergone any extensive delays. Anymore, most places
do want me to fire up my laptop and show that it can do something.

Leaving Aberdeen, Scotland a couple of weeks ago I was subjected to
the most intensive scrutiny I've ever seen. Though quite cordial, the
security officer asked me to light up every little item in my
briefcase: pocket calculator, battery-operated shaver, mini-maglight,
and of course the computer. The he found my "hushers" (Noisebuster
head cancelling headsets.) He asked how those worked and I explained
that if we wanted me to show him he would need to put them on. He
did, and I fired them up. When they went into operation, he responded
"Brilliant!" and sent me on my way.

The WS has 10 Search ranges . They come preset , but are able to be set.

The R1 is more rugged.

The WS is a slower scan rate, (I think)

The keypad isn't bad at all.

>
>Already done this, 30ch / sec. is still slow when compaired to 50cps as the
>PRO2035 or 100cps as for the PRO2036.

Yes, 30-ch/sec is slow compared to 50 or 100 ch/sec when you don't have an antenna connected, and are using a stop watch to measure the E.T. of scanning ch-1 to ch-400 or whatever. I repeat again that when there are signals to monitor, and if one actually assimilates the RESULTS of scanning, then speed is not much of an issue. It is an overrated issue....a false value. Speed is what the entry-level scannist asks about as he goggle-eyes all the glitz and glitter..... a lot like the guy who kicks the tires of a car he'ss about to buy.

But yes, there are times when 100-ch/sec is very desirable compared to 30-ch/sec. Pity that 100-ch/sec scanner is a piece of trash compared to the PRO-2004/5/6 series. Funny how 100-ch/sec scanners are nothing new, and yet none have "taken over". Figure it out. Speed isn't everything.

>Well I learned something, so the European CPU's cant cover 30-50? That is a
>band I can't live without (But I can live without Cellular)

I don't know that to be the case. It is just a question I posed since many Euro scanners are not equipped with the VHF-Lo band.

>>Have YOU ever replaced a 100-pin surface mount CPU that occupies an
>>area of less than 1 square inch?

>You can buy the whole PC board that contains the CPU

And get 12.5 kHz steps for all that money. Cool.

> (yes more money, but isn't that what cell is all about? MONEY....Rich
> people playing with phones in their car, or Gov't Officials makeing
> STUPID Laws that will just take more money away from the working public?

I dunno about that. I'm closer to the Salvation Army Soup Kitchen
than to a hacienda on a hill, and I have a cellular phone for my
daughter to take with her where ever she goes. I'll pay a little
extra for increased safety for her.

> ---steping off my soap box---sorry.

I am not emotionally attached to people's soap boxes. Doesn't bother
me at all.....

>>>I just don't know what the 2006 hype is all about,

>>Where exactly do you see this "hype"?

>Seems like that is all I see is 2006 this 2006 that

Where? "Hype" is shown in the dictionary as follows:

==========
hype: Slang. noun
1. Excessive publicity and the ensuing commotion: the hype
surrounding the murder trial.
2. Exaggerated or extravagant claims made especially in
advertising or promotional material: "It is pure hype, a
gigantic PR job" (Saturday Review).
3. An advertising or promotional ploy: "Some restaurant owners in
town are cooking up a $75,000 hype to promote New York as
'Restaurant City, U.S.A.'" (New York).
4. Something deliberately misleading; a deception: "[He] says
that there isn't any energy crisis at all, that it's all a
hype, to maintain outrageous profits for the oil companies"

verb, transitive
hyped, hyping, hypes: To publicize or promote, especially by
extravagant, inflated, or misleading claims: hyped the new book by
sending its author on a promotional tour.
[Partly from hype, a swindle (perhaps from HYPER-) and partly from
HYPE(RBOLE).]
==========

Thusly, I am not able to relate to your allegation of "hype". The
PRO-2004/5/6 series are not on sale; they are not advertised except by
individuals now; and there is nothing misleading about what IS said
about them.

> or 2004 this (talk about an antique).

Yes, an antique, the circuitry of which the predominant share is still
plainly evident in the modern PRO-2035 and PRO-2042. In fact, as pure
receivers, the PRO-2035/2042 are poorer performers than the
PRO-2004/5/6 series. This is due in part, to design changes to meet
more stringent certification standards.

Not only that, but the PRO-2004 has an all-metal case for excellent
shielding.....tons of space and easy layout for adding wicked

modifications.....AND nothing to date beats its tactile, easy to use
sloped control pad. I'd like to see the nimble-fingers who says he's
good at operating the PRO-2035/2042. Hah! Their keyboards are
utterly deplorable.

>Like I said above, I need to scan alot of channels fast in order to catch the
>Mil Air Comm or VHFlo Skip or AF1 Phone Patch and the 2006 is not as fast as
>alot of other scanners on the market today.

So? Once you connect an antenna to the scanner and start listening to
signals, speed all but drops out of the equation.

>>Please explain your views, if you will. Your reasoning, thus far,
>>escapes me. Play like I'm dense and elaaborate on your views to me.

>I think I've done just that......

Not clearly and factually, you haven't. I did see an emotional outcry
of sorts.......and a vague reference to "need for speed", but the case
isn't clear at all. Speed ONLY counts when you are NOT listening to
signals. But the purpose of a scanner.....I thought......was to
intercept signals for listening by the user.

<shrug>

I am all for considering and evaluating your ideas, but I am confused
on your cry of "hype" and undue emphasis on speed.

>Question(s):
>
> What's the freqs for audio from channels 2-13 of local TV stations? Can
>you generally get these freqs on typical scanners?

The spectrum occupied by TV Channels 2-13 is as follows:

2 54 - 60 MHz
3 60 - 66 MHz
4 66 - 72 MHz
x 72 - 76 MHz (Little known utility band - cool sometimes!)
5 76 - 82 MHz
6 82 - 88 MHz
7 174 - 180 MHz
8 180 - 186 MHz
9 186 - 192 MHz
10 192 - 198 MHz
11 198 - 204 MHz
12 204 - 210 MHz
13 210 - 216 MHz

Each 6 MHz band contains the video, sync, and audio information at standard offsets from the main carrier. The audio is a separate FM transmission, however, and is positioned exactly 250 kHz DOWN from the upper end of each band. For example, the audio of Channel 2 is right on 59.750 MHz. Channel 10 is 197.750 MHz.

Two weeks ago I traveled round trip between JFK and Rome on TWA. My
Uniden scanner was in my briefcase and my Grundig YB400 was in my
carry-on garment bag.

Neither radio raised any eyebrows in either airport. Both bags went
through x-rays and were not hand checked.

As a precaution, I carry the owners manuals for the radios as well as a
copy of my amateur operators licence when I travel with my radios.

In the past, I have traveled domestically with my HTX-202, again with no problems.

I hope this helps you,

73,

John, KB2YJH

>a PRO-26..

Nothing by itself. But a number of modifications and add-ons to scanners need a line-level, unfiltered, raw "audio" signal of the type that's before the volume control. The best raw output signal is right at the output of the scanner's discriminator circuit.

The methodology involves soldering a 2.2-uF capacitor (+) to the scanner's discriminator output pin and (-) to a handy output jack on the back panel or side case of the scanner. Now the "baseband audio" signal is handily available for recording, processing, or whatever you need to do with it.

I'll bet your computer case is not metal. If you good with computers,
you can buy a new case for about $50 and assemble all your computer parts
inside it. Look for cases which claim to have good EMI (electromagnetic
interference) shielding.

Since the rabbit transmits in the 900Mhz band as a part 15 device to
increase the power would thus make it an illegal amateur transmitter.
Sleep better at night and buy a second VCR or run cable to your bedroom
from living room.

More than sufficient, provided you and your buddies have the same seven channels. If you are the only one providing radios for an outing, event etc, than you are set. If not, there is an issue of compatability to be raised with a 7 channel radio on a 14 channel service...

Hello Mike!

Thanks for your continued interest in the Los Angeles City Fire Department (LAFD). Anytime you or others have a question about our agency and its endeavors, please feel free to post it here. I try to scan this newsgroup at least three times a week.

A --complete-- list of our (24) licensed voice radio frequencies can be found at our website. You can go directly to this official list, which includes the PL tones, by setting your webbrowser to:

http://www.ci.la.ca.us/dept/LAFD/freqncy.htm

We also use a variety of other frequencies for Mutual Aid and the Standard MED and HEAR frequencies for the mediacl telemetry between our Paramedics and the medical control physicians at the "Base Station Hospitals". These numerous frequencies an be found in the POLICE CALL, SCAN-FAN or any of the other excellent publications available in Southern California radio hobby shops.

BTW, the main front page for the LAFD website is:

http://www.ci.la.ca.us/dept/LAFD

You also asked...

>Are they using two-way radios or walkie-talkies?

We use a combination of:

- BASE with 9 remote transceivers/repeaters (for contacting dispatch or repeating fireground transmissions)

- MOBILE radios that are mounted in most of our vehicles

- CONVERTIBLE radios that are mounted in -some- of our vehicles. These require we plug our Portables into a "gutless" control head to communicate through the vehicles hard-wired microphone and antenna when in the vehicle.

- PORTABLE radios, commonly referred to as "walkie talkies".

>The reason I am
>asking is a Light Force was dispatched to my apartment building
>and after the EMS were inside I heard them talking to the engine
>thru the loud speaker. But I had nothing on my scanner.

Though our radios are most often operated in the full-repeat mode (which is why you can hear radio traffic from our personnel inside a building more than 50 miles away), we do have the option of easily setting our radios to simplex (non-repeat) mode for tactical information that need not be transmitted over a long distane or is only of local interest (residence to curbside is a perfect example).

While Tac channels are assigned by dispatch for complex incients, it is most common for simple fire incidents to be coordinated on their Division Operations frequency (Channel 3 in your neighborhood) and for EMS incidents to be coordinated on Channel 10 citywide.

>Thanx in advance for any help in the matter. I feel it is the last
>piece of the puzzle for monitoring the LAFD.

You are most welcome. As any long time monitoring enthusiast will tell you, there are always puzzles to unravel in our dynamic hobby.

>Good scanning makes good friends,

Yes it does.

Monitor Safely!

5765. Civil Aero Band Frequency Increments?

Newsgroup: rec.radio.scanner
Date: 1996-09-23 00:00:00 UTC
From: hpeach@pop.uky.edu
Message-ID: <526oek$dl6@service3.uky.edu>
Source record: 222460

It is my understanding that frequencies in the civil aero band are allocated in 25 kHz increments (i.e., 119.1, 119.125, 119.150 ... etc.). However, I have notcied that pilots departing our local airport are instructed to contact the ARTCC on 126.37 instead of 126.375.

My question: When a pilot switches to 126.37 on his aircraft radio is the radio actually transmitting on 126.370 or 126.375? I know that from a practical standpoint this has no effect on my ability to receive the transmission, but I am confused by their tendency to drop the 5 kHz.

Also, if the radios only tune in 10 kHz increments, can the pilot switch to a non-standard frequency such as 126.11?

Cross-posted to: alt.radio.scanner.uk,alt.radio.scanner,rec.radio.scanner

```
PD (POCSAG Decoder) Version 2.03
--------------------------------

**** Announcing the release of PD version 2.03 ****

PD is an MS-DOS program for decoding POCSAG paging transmissions on an IBM
PC or equivalent, 80286 processor or later.

PD requires a simple interface between the audio output of a scanner or
receiver and a COM port on the PC. This is described in the documentation
file.

VERSION 2.03 September 1996

* Increased maximum size of paging message received to 1000 characters.
* Made input pin selectable between CTS and DSR for use with Hamcomm and
Optolinx type interfaces.
* Increased timeout in shareware version to 15 minutes.

PD is distributed as shareware. The shareware version has a 15 - minute
timeout and does not log to disk, or output messages serially. Upgrade to
the full version is by a key file available from the author on
registration, which costs 20 Pounds Sterling.

Registered users of PD may unlock version 2.03 using their existing
.KEY file.

PD 2.03 may be downloaded from the following sites:-

http://www.bearnet.demon.co.uk/pocsag/

http://www.seelect.demon.co.uk/pocsag.html

http://www.keplens.co.uk/pager/

ftp://ftp.demon.co.uk/pub/ham/scanners/pd-203.zip

For any info email Pete Baston <pete@bearnet.demon.co.uk>

> I have a RS 2005- and from lots of use the buttons got depressed,
>Can I clean them to make them pop out or do you have any ideas ?????

Grind up a little Prozac in distilled water and
scrub the depressed buttons with the solution. After
several weeks they should begin to feel more normal. Some
additional counseling may be required for full recovery.

>126.375.

That's just ATC shorthand. The actual frequency is
126.375. The radios dial in 25 kHz increments, so the pilot
cannot dial 126.370 even if he misunderstands the handoff.

>
> - EA
>

Are they putting better batteries in the 8K . My 8K is over a year
old and the stock Fuji Novel FR-700 would only last about 6 hrs.
I have used Sylva-charge 85 , Radio Shacks Hi-capacity, EH Yost Gold
1000 ma, and Golden Power MR1000 NiMH with the same results 6 hours.
I have tried charging them at different rates and can't seem to break
the six hour charge. Scanning 50 channels at half volume.
The only other radio I know eats batteries faster are the Motorola
Astros.

There seemed to be some doubt from a few folks about Ron Courseys' "New Radio Shack PRO-2006" post. I received mine today and it is BRAND NEW and UNOPENED.(They are not re-packs). He aquired 250 of them from a government auction. I had read a post that said "There is no way that these can be new". Well they are new. I ordered a second one today.

Personally, I would rather pay $350 for a new 2006 than to pay more money for 2035's 2042's etc. It's a much better radio.

Anyway it's a legit ad. Just my 2 cents worth.

Greetings all.

Richard

Well, this is probably a dumb question, but is there an easy mod for the RS PRO-2040 or (as I assume from reading about) the only way to get cell coverage is to put in a new processor?

I started writing the EXPERIMENTER'S WORKSHOP column for
"Monitoring Times" magazine in July, 1991. Over the years, a wealth
of material has been published in my column that has pertinence and
relevance to many topics and questions asked today. Much of this
material is accompanied by graphics, photos, charts, tables, and text
too detailed to put into simple ASCII text in this forum. Hard copy
remains the best media for assimilating material of this depth.

I understand that Monitoring Times provides reprints of articles from
the back issues at a very reasonable cost, so following is a Table of
Contents to all the articles that I've written for them to date. This
is a service to the newsgroup - I don't make a dime from it. The
material is there for those who want it.

BILL CHEEK'S PROFESSIONAL RESPONSE TO TYLER BY E-MAIL FOLLOWS:

I thought you were a ham, shithead?

If so, you ought to know that a 75-50 ohm mismatch causes a 1.5 :1 VSWR, the loss of which is 4% or less than 0.2 dB. The MUCH lower loss of RG-59 with respect to RG-58 makes the proposition a net GAIN, you stupid asshole. And it's even more exemplified with RG-6 satellite cable.

Get with the program, Numbnuts.

Tyler replies as follows:

If you know you are right, which you could be, (although I really don't know why you wouldn't just match the cable anyway) why do you deem it necessary to

swear and curse at me? Is that really needed? N3SPD

No, it isn't. It's capacitor/coil controlled. Does this mean the drift cannot be controlled? And if not, does it just keep climbing? Reach a point and start over? Can the capacitor be replaced with a crystal, or does it require a different printed circuit board?

Thanks.

>Does anyone have an good scanner antenna they would recomend? I have a
>pro-2006. Are the Radio Shack Discones any good?!

A discone by any other name is still a discone. The Radio Shack discone has to be made equal to the others, however. The Icom AH-7000A and the Diamond D-130J are superior to Radio Shack's, not only because of better construction and materials, but also because a VHF-Lo band whip is included for improved coverage of 25-100 MHz. Radio Shack's discone performs between 100-1300 MHz. The other two do well between 25-1300 MHz.

You can add a shortened CB whip to the stud atop the Radio Shack discone to enhance its low band performance, but there is still the matter of inferior materials and construction. The Icom and Diamond discones are clearly the better.

Catch-22? No discone is what you can call "good", unless your frame of reference is to bandwidth. They...they're very good. Trouble is, that very widebandedness of a discone renders its GAIN to 0-dB for all intents and purposes. Maybe less.

Rocks and hard spots? Yup. An antenna with GAIN ordinarily does not have wideband coverage that scannists need. So most scannists opt for the discone and let it go at that. But that is not the end of the issue. It is only the beginning.....

The DATA SKIP feature of the PRO-26 is reputed to be buggy and largely non-functional. The several that came through my hands certainly did not work properly. The BC-3000XLT and the PRO-26 are close clones of each other, but I don't know any more than that. Both are made by Uniden, but there are subtle differences between the two, of which the BC-3000XLT may be the superior.

For the PRO-2004, PRO-2005, PRO-2006, PRO-2035 or PRO-2042, my widely published add-on MOD-44 Data/Tone Squelch *is* extremely effective at enabling the scanner to disregard non-voice signals and keep right on scanning or searching. It is likely that's where Uniden came by the DATA SKIP feature in the PRO-26 and BC-3000XLT. My Data/Tone Squelch was first published in 1990, so it's had time to get around by now.

Maybe some PRO-26 and BC-3000XLT users will pipe in with specifics.

Radio Shack PRO-23 Scanner for sale. Pristine and seldom used condition.
All manuals and boxes available.

Will sell for $100. All manuals and boxes still in pristine shape, as is
the scanner.

Offers considered.

50 channels divided into 5 banks. Covers 800 MHz, aircraft, police, etc.
Backlight display.

I got it a close-out prices.

Ship via UPS/USPS C.O.D. (to protect both of us).

Email for more info!

Hmmm... I have a bunch of these things that I got at a close out sale
(pretty good ones, too) that xmit in the 900 MHz range.

I just happen to have a technician class Ham licence. Can these be
converted easily to Amateur TV transmitters? I've wondered about this
before, since they seem to xmit in the 900MHz ham range.

The point is probably moot, though, because I don't think we have any
ATV repeaters near my home.

> However, there is little reason to produce such radios, as it is just
> as easy to provide 40 channels.

The type acceptance rules prohibit the manufacturing or marketing of any
CB transmitter that was type accepted before September of 1976. This
was about the time the 17 additional channels were made available.

It was my understanding that the reasoning behind this was to quickly
get users to the new channels and ease frequency crowding. You might
remember that CB was really busy back in mid 70's. The logic was that
some manufacturers might have continued making the 23 channel models-
this would make the 40 channels radios seem less useful. Eventually
this rule required everyone to get new type accpetances - a process that
made going to 40 channels easy.

However, I have never seen anything in the rules that says a CB has to
have 40 channels. Using a 20+ year old CB is still legal - you just
can't market or manufacture such a radio anymore.

Regards

5805. Q: Moto' Saber display flashes on Tx. Moto' says normal!! Help please.

Newsgroup: rec.radio.scanner
Date: 1996-09-24 00:00:00 UTC
From: csupak <csupak@ucla.edu>
Message-ID: <3248303A.B06@ucla.edu>
Source record: 222134
Cross-posted to: rec.radio.swap,rec.radio.scanner

Hi all

My question to the group mind is this: When I try to transmit simplex on any UHF frequency at 4.0 watts or above my Saber's display "recycles" and dumps me back to CH 1, Zone 1. If I set to Tx power level below 4.0W the radio's fine. If I transmit through a repeater I can set the Tx to 4.5W, but no higher, without the radio reseting itself. All other radio settings are nominal. I've rechecked several times. I've called Motorola several times, frustrated,
about this problem and talked to the service tech's. All they can say is "That's normal.
We make good radios but bad CPU's. RF's getting to the brain and causing a reset. Send it in." They offer no other advice. It stands to reason that if the CPU was bad the
radio would be dead or intermittent. It's not. It's as new both in and out. I've looked. It's otherwise perfect. Works great, at 4 watts.

Now, since I bought this radio for work (I'm a medic), used for $500., and have no warranty on it and a new board costs several hundred I have a problem. IS 1.5 watts worth $200?

Has anyone else had this problem and found an answer to it? Shielding advice would be great.

Thanks very much. Matt D.

--
First they came for the hackers. But I never did anything
illegal with my computer, so I didn't speak up.
Then they came for the pornographers. But I thought there was
too much smut on the Internet anyway, so I didn't speak up.
Then they came for the anonymous remailers. But a lot of nasty
stuff gets sent from anon.penet.fi, so I didn't speak up.
Then they came for the encryption users. But I could never
figure out how to work PGP anyway, so I didn't speak up.
Then they came for me. And by that time there was no one left
to speak up.
It can happen folks

5806. Help Indentifying 152.010MHz

Newsgroup: rec.radio.scanner
Date: 1996-09-24 00:00:00 UTC
From: seanp@chesco.com
Message-ID: <3248245a.140329038@news.chesco.com>
Source record: 222135
Cross-posted to: rec.radio.scanner,phl.scanner,alt.radio.scanner

I am trying to locate the licensee of the frequency 152.010 in
the West Chester, PA area. This frequency is interfering badly with
cable channel 19 and I need to know who the carrier is so that I can
contact them to try and correct the problem..

Could someone please consult an FCC database and tell me who operates
on or near that frequency in the West Chester, PA area? It will be
someone that has to do with paging.

All help is greatly appreciated.

Sean

Definitely is..... also cellular phone, and 900 Mhz cordless phones.

Message-ID: <32483E2B.75B4@ix.netcom.com>
Source record: 222142

It is possible to quasi descramble speech inversion used by cordless phones, DOJ and others. ----------
First you need a scanner that has SSB such as the AR8000.
Set your mode to LSB or USB and tune off freq. (1k steps at a time.)
You will hear a high freq. whine but, you can understand the traffic.
And NO this does not work for spread spectrum phones or other types of scrambling modes.
I am not even sure if this will work for other types of scanners that have a BFO for sideband. (the AR8000 uses carrier insertion)
It works for me ! (for test purposes only on the corlesss freqs. as this would be illegal,and we wouldn't want to ever break the law and monitor such activities....yeah right).

Does anyone have any good information on San Diego area MilAir frequencies? I have a copy of ScanFan and it lists *tons* of frequencies, but most of them aren't used on a regular basis. I'm trying to listen in on their offshore exercises. Also, if anyone has a good list of SD military callsigns or area designation signs, I'd like those too. Here are just a few of the frequency/area names I hear often:

Starburst
SweetLock/SweetComm (sp?)
Papa-1 through Papa-5
Warchief
Whiskey

I've been considering ordering some Aeronautical charts of the area to see if it has any useful information. Does anyone ever use these charts to help in scanning?

I'm also interested in any other interesting military frequencies that can be picked up in southern Orange County.

Source record: 222150

Hello, and thanks for reading this. I picked up a Regency HX-1000 hand held programmable scanner at a local yard sale this weekend. After some cleaning, I plugged it in and attempted to program it. Seems to have some problems when entering frequency numbers. It will double add a number like 55 instead of just 5. After some effort, and if you press it just right, you can enter the desired frequency and go on your way. Overall, it works OK, not bad I guess for $5.00. I do have one major disadvantage. After entering any 500 MHz frequency into the scanner and listening to the specific entry, The transmission sound very distorted. Similiar to someone talking under water. All other frequency bands are loud and clear. Any suggestions? Is it fixable? I am also looking for a manual if someone has it availible. I will pay for copy and shipping if required. Thanks again for taking time to read this.

Works with the Icom R7000 too. As with you this was only found under
controlled
labs conditions so as not to break any local or Federal laws. :-)

>contact them to try and correct the problem..

KEYWORD: "licensee"

Being that they are the licensee of the frequency, and your cable
company is not, there is NOTHING you can do to remedy the problem
by contacting them.

It is your cable company which is at fault and therefore they are
who will have to fix it. What your cable company has, is a radio
wave carrying enviroment which is separate from the regular airwaves.
This enviroment consists of the cable. The theory is, outside signals
don't get in, and inside signals don't get out. The entire enviroment is
maintained by the cable company. It is THEIR "shield".

Unless you possibly have your own home-job wiring for your cable,
your best bet is to call the cable company and have them fix the
ingress to their cable.

If your cable company is not willing to take care of this problem, your
next step might be to call the FAA or FCC and report them, since where
there is ingress, there is usually egress, and the FAA doesn't take too
kindly to cable companies bleeding channels 14-16 into their aircraft
safety frequencies.

But beware... make absolutely sure that the problem is not in your
home first... make sure that you are not using zip cord for your
cable to tv connection, but rather, 100% shielded cable with solid
conectors on each end... or else the cable company, FAA AND FCC might
hold you responsible for the leakage.

Did anyone question you, or were you "secret agent man"? I flew TWA and got caught, needless to say the attendant wasn't happy at all.

"Shall I have the captain talk to you about it?" she asked.

I am going to Atlanta soon on US Air, will I have to be incognito so I wont be incommunicado?

5837. Real Audio Problem

Newsgroup: rec.radio.scanner
Date: 1996-09-24 00:00:00 UTC
From: "Scott A. Nelson" <scottnel@iw.net>
Message-ID: <3248B59C.4675@iw.net>
Source record: 222166

Anyone ever have this problem? I get into RealAudio fine, it seems to work o.k. Then when I close the RA Player and go to another webpage, I get a General Protection Error. I have to close all windows and then open Netscape again. Any clues???

5842. Re: Radio Shack 2005- How to clean depressed buttons???

Newsgroup: rec.radio.scanner
Date: 1996-09-24 00:00:00 UTC
From: andyb@qni.com
Message-ID: <527de9$l8l@suba01.suba.com>
Source record: 222171

May sound silly, but I had a scanner with the same problem (not a Pr0-2005, but the old 2002.) I was cleaning the case with Lemon Pledge, which works quite well I might add, and it apparently lubricated the offending button enough that it popped out. After that, I did it about every 6 months to avoid the problem.

5843. Need San Antonio Freq's

Newsgroup: rec.radio.scanner
Date: 1996-09-24 00:00:00 UTC
From: bobropes@smokey.prismnet.com
Message-ID: <527h2o$6d4@ferengi.prismnet.com>
Source record: 222172

Hello All,

My good friend and radio/scanner buddy in San Antonio asked me to ask you all if you have any good freq's for San Antonio. He already has the Radio Shack books but they really do not give the correct freq's for police and such. I am in Austin and I got mine via the net. If any body wants a good Austin list just e-mail me and I will send it. Thanks for any help.

Remember when Bearcat had the compuscan? Yanked it off the market and said it would never sell. Seems Bearcat thought computers were a passing fad. It took the add on market, such as the Optoscan to prove that hobbyists wanted this functionality. The OS456 Serial Interface has dip switch selectable baud rates up to 38400 baud. The scan rate of the OS456 is partially dependent on the baud rate. Faster baud rates allow more frequencies per second to be sent.

For something really far fetched, how about GPS coupled in? You could set frequencies to be automatically dependent on your location. Even in a metro area, this would be useful as you go to different sections of town.

I'd also like the multiple priorities. For example, in a weather emergency, I listen to different channels than normal. I know, you can program them in different banks. Trouble is, I tend to forget the bank setup for lesser used modes. It would be nice to have a menuing sytem to quickly get you to stored modes. Would be nice to have higher resolution displays to accomodate this.

And, yes, I would pay for the right combination of features. Look at the amateur radio market. You can buy a good transceiver for around $1000. You can go to the top of the line iCOMs and easily pay $5000 or more. Obviously there's a market for the high end. Radio Shack isn't going to cater to it, so one shouldn't build an opinion of what's feasible by what Radio Shack says. They build good stuff, but they're geared to a wide market segment. Like you mentioned, it seems AOR is the most open minded about the high end of the market.

Scott,

I do believe that such an item can be built although I have not done so. Electronics are electronice regardless who builds them. What they are probably talking about is not free cable but illegally descrambling scrambled cable signals. If you get caught with one of these things I believe there are penalities. It may not be worth the risk.

>wondering if there was a quick fix that would add MORE POWER (grunt grunt
>grunt) to this thing.

If you want to increase the distance, a far simpler and more effective way
is to improve the antenna. Since this thing thansmits at 900 MHz you can
easily make a two or three element Yagi antenna on either the transmitter or
receiver or both, and your range will improve significantly. If you need
more range, simply add more elements.
Right now, the little whip antenna that's on the thing sends the transmitted
signal in all directions. By making a better antenna you will be
concentrating all the power into one very narrow and powerful beam.

Heard the rebroadcasts of the undocking of the Shuttle and Mir in
the San Fernando Valley, California on 448.5000R. Thanx Tracy!

Nothing heard on 146.670. Sorry Ken!

BTW, What is the location of the 75 centimeter band repeater?
I come in nice and clear on my "rubber duckie" BC200.

It has SSB.

> run it about 10 hours straight at work.

Hmmm, here the AR8000 with nicads falls short. Mine only goes about 5 hours on average, but I always keep a spare charged set to swap out. I'll bet you get close to 10 hours with fresh AA alkalines though. Not sure what performance is with NiMH or Renewal type batts.

> I also need a radio that will function well in a high noise
> (electrical) area. Are any of these suitable?

My AR8000 does OK, but gets birdies if near a computer.

Mike

I am trying to increase the bandwith of the IF Filter on my radio(bc855xlt) to decode cellular data
streams. I was told that 20khz would be the proper width. I am not sure what specifications I would
need when ordering the replacement filter, where I would get such a filter(I checked digikey and
mouser), and exactly which filter I would be replacing on the IF Daughterboard. Anyone that has tried
this or knows what I would need to complete the job, please e-mail me at: cryptic@pb.net
Any help would be greatly appreciated.

Thank You,
Cryptic

Beats me why he made that claim. They certainly are not higher power.

You can still buy three channel handheld radios from Radio Shack. I see
no reason why 23 channel radios would be banned.

However, there is little reason to produce such radios, as it is just
as easy to provide 40 channels.

Bill

Okay I was wondering which cordless phones operate on 900mhz without spread spectrum and also in analog?(in other words easy to listen to)

Please post some brand names and freq's.

Does the analog tropezl use the same 25 channels as the Digital model??
Anyone use the new Digital Spread 900mhz Santo phones yet??

I am in Canada. (I was please to hear a new 25 channel cordless phone down on 44mhz the other day for the first time!!yeah!)

The best information is disinformation.

5866. New IRC Scanner channel

Newsgroup: rec.radio.scanner
Date: 1996-09-24 00:00:00 UTC
From: dan.morgan@worldnet.att.net

For those of you that may be interested. I have started a new channel on IRC called Scanner_Radios. This is intended as another form of communication between Scanner buffs. Here you will be able to ask any question, swap frequencies, find out what mods are available for your scanner, whatever you want. You may not get the answer you want but at least you will be able to chat with someone else is close to real time.
One thing that will NOT be tolerated are flames of ANYONE else. I don't care who it is or who starts it. The flame wars here will not spread to the new channel. I will kick and ban anyone that does so.
I will try to keep the channel up at all times but obviously, I cannot be there all the time to chat with you. Let's try to make this a good option to these newsgroups.

Hope to see you there!

Bill, really replying to the original question. 23 CHANNEL CBs
were NEVER "BANNED" by the FCC. This is folklore, rumor, and what not!
If an banning took place, it was in the marketplace (only) by the
simple fact that 40 channels were most desireable. And, those with
SSB capability offered a "great new adventure" for CBers to escape
the noise and vocal crap of 23 CH AM. This is the reality of the
marketplace.

-=Tony=- "one who was there" and watching all the hype.

You're the idiot, Joe.

People have been able to write to my fido address, which is public knowledge & listed in the online directories. That is "my e-mail address" that I am referring to you fool. I have had that address for over a year.

Regarding what I labeled as a complainer or supporter, I relate that to the types of e-mail I received.

> grunt) to this thing. If you have a mod I could theoretically do, or a
> pointer to this info, I'd greatly appreciate it. Tnx
>

I tried out a bunch of those 900MHz TV sender things. The Rabbit
was the *worst* performing of the bunch. Typical useable range in
a residence was about 15 feet. It also drifted like hell. Very
poor video quality (and they can also mess up 900MHz cordless
phones). Don't bother with it!

The best solution I have found is the "WV-050 UHF Videosender"
UHF transmitter.

Available from:

Black Feather Electronics
645 Temple Ave. #7
Long Beach, CA 90814
1-800-526-3717
V:310.434.5641
Fx:310.434.9142

WV-050 Videosender
Around $35 US (Not Avail in UK)

It transmits on a standard UHF channel, so no clumsy "converter"
box is needed on the receiving TV's. Just their regular UHF
antenna and tuner will suffice. It sends a good, *stable*,
useable picture about 50 feet. The unit is about the size of a
pack of cigarettes, and runs off of 12VDC (AC adapter is
included).

WARNING-WARNING-WARNING It comes from the factory tuned to
UHF channel 15 (476-482 MHz). This may be okay for most areas.

HOWEVER, in some areas (like here in the SF bay area), channel 14 may be in use, causing some interference to Ch 15.

You may be tempted to tune the transmitter up to Ch 17 or so, to avoid interference. **THIS IS NOT ADVISED!** In some communities, Ch's 16-18 (482-500 MHz) are used for 2-way radio communications, including police, fire, and ambulance services (especially 488 & 491 MHz here in the SF peninsula). If you must re-tune the transmitter, tune it for channel 20 or higher. Otherwise, a very angry Sheriff Taylor may come knocking at your door!

The unit is very simple and straightforward. Anyone familiar with RF can figure out how to tune it. You have to bend a coil to get it into the "ballpark", and then "fine tune" it with the trimcap.

If anyone needs a little more help in tweaking it, just send me a e-mail request, WHEN YOU HAVE THE UNIT IN YOUR HANDS, and I will send you more detailed instructions.

My unit is in every day use linking the living room VCR (used as a tuner) to the kitchen TV. Works great!

I'm not sure. It should be listed in one of the HAM repeater books.
If I'm getting it all the way in W. Simi Valley then I suspect that
it's probably on Mt. Wilson.

BTW: I have a BC200xlt and can only pick it up with my discone
mounted on top of my TV antenna. I'm near the 118 and 23 fwys.

Moving around the province or just got that new scanner. Don't be
fooled by the frequencies that some people give you, be sure ! ! !
I have two of the latest lists of frequencies for Nova Scotia. From
2 Mhz to 23.4 Ghz. I can land mail a diskette, e-mail you the two
lists for only $10.00. Each list is about 1 Meg long (200 pages).
These lists are far better than those $ 24.95 Scanner Books out there.

The president of the United Arab Emirates is in Rochester, MN for some business. He was escorted from the airport by a motorcade of 15+ vehicles last night. Any ideas what freqs might be in action for this his visit? I found the motorcade coordination frequency to be 155.475 (the Minnesota Police Emergency channel). I could not find any other activity regarding him on any other channel I have.

I am sure the FBI must be involved, as well as the secret service. Any help would be appreciated.

>these people?

Same thing that I am fixing to tell YOU, my fine, nescient, duly
licensed and approved amateur radio oprator. Take notes. I will be
giving a pop quiz later:

All self-respecting amateur radio operators with official licenses
from the Federales know that a 75-50 ohm mismatch causes a 1.5:1 VSWR,
the loss of which is 4%. This equates to a loss of less than 0.2 dB.

The lower loss of RG-59 with respect to RG-58 makes the proposition a
net GAIN. It's even more exemplified with RG-6 satellite cable.

Back to Boy Scout Merit Badge Radio for you, Numbnuts. Now turn off
the attack mode.

>Tyler AMATEUR RADIO OPERATOR. N3SPD. Yes Bill, it is a simple law of
>physics. The inductance of a coil is determined by the core material.

It's also affected by many other things.... :-)

> If you place a metal screwdriver near the coil, the inductance changes.
> I'll look it up for you if you'd like.

Geezus H. Kriste, are you dense or what? There are no coils in X-301.
What's it going to take to get that concept hammered through your
thick skull? If a coil will be affected by any procedure that I write

about, I will give due caveats and probably specify the proper tuning tool, if one is substantially better than another. If I don't specify something of that nature, then it just doesn't matter.

In the best interests of brevity and to avoid the costs and confusion of verbosity, I do not make a practice of giving a Basic Electronics Course in everything I write. What I do write is to the point and tailored for the needs and idiosynchracies of the specific project.

If you feel you can do better, then by all means, pal, belly up to the bar and get yourself counted. And then write! Stick it out. Let's see what you're made of, if not "attack-cheese".

> If so, do you know the part number and cost?

YES!! ...Uh, I think so, anyway....

One of the redeeming qualities about RS...they have readily-avialable parts and accessories for almost *any* product, as long as it is not older than, say, 10 years.

Go to your nearest friendly RS, and find the display that has about 6, or 7, 3-inch binders laid out in a row...there's a lighted display above it, and every RS I've been in has seen fit to place their fax machine there....therefore, easy-to-find. Track it down in the store, and you've found your answer:

All of these binders contain RS's products/accessories/parts that are available vial mail. After 90 seconds of searching, you can probably find the list of parts for the pro-43, (if not, look on your pro-43 for a catalog #.....starts with a 17, if I'm not wrong) write down the part # you need, and take it to the counter. Chances are, the sales droid you will encounter knows less than you've learned in the last 3 paragraphs.

In case your pro-43 is so worn that you no longer have a cataloge #, ask the droid if he can "call and find out..." He has an an 800 # set up for RS employees to ask where/what/when questions about RS products. Lord knows I used it dozens of times....and damn, if the operators weren't right-on, *every* time. (It is very telling that RS deems it necc' to properly train & equip corporate support operators with extensive technical information via GUI software, yet doesn't seem to think that the salesfolks are worthy of the same. Ah, well...)

Hope this helps, and maybe other members of this newsgroup can chime in on the cataloge # of the pro-43.

Jay

How do you know the licensee is interfering with channel 19?

Did you ever stop to think that the cable system might be so
poorly designed as to allow outside signals to enter it? Or
that your own installation might be so poorly connected as to
permit signals to enter it?

The NAM and ESN info comes across a scanner as a quick blirp or chirp or bleep during a phone conversation unless you listen to a tower frequency and listen to it constantly. Scanners don't do anything with that data. You'd need a NAM/ESN reader made specifically to read those numbers.

>Yes we can, but we don't need to demand, just highly suggest.

Right. Who would welcome and receive your "suggestions"?

> Tell them >what we want, bombard them with email, snailmail, lists and
> suggestions.

Right. And you think THEY will pay attention? Ha ha ha. You're
kidding. But WHO exactly are you talking about?

>Customers drive the market with users groups. Here at rec.radio.scanner
>and other newsgroups affiliated with the radio interests are the areas
>that we can get the attention of the users to tell the marketing people
>that control the engineers.

Right. But WHICH marketing people and WHICH engineers? And what
makes you think they will care?

> WE THE SCANNISTS...
>
> I propose that we start a users group to discuss what we want, what we
>expect and let US! drive the technology our direction.

Right. That will go over about like boiled egg & beer flatulence in
church. It's already been tried. Why not join the one that's already
in existence? The National Bearcat Club or whatever it is called?

>should not be held back by mere trunking and digital protocols.

We shouldn't be. But the LAW holds us back there. You need to go to
Congress; not the scanner manufacturers. Trunked Follower techniques
in either hardware or software will broach the LAW, pal.

> Upgrade on the fly. We must not be held back by novice wisdom. Novices always
>want more knowledge and then they need to spend more money on all new
>equipment. This is a marketing ploy. KISS. Keep it Stupid Stupid.

Be THAT as it may, WHO are you going to lambaste with this flood of requests for high technology>

> We need the chance to do our homework.

Right. That's what you need to do first. So consider the following critical elements to be a part of the homework lesson:

WHO is to be the target of your campaign?

Uniden, Radio Shack, and AOR are the predominant manufacturers of scanners sold in the USA. Consider carefully none of these scanners are made in the USA. It will do no good to bombard the USA distributors with your campaign.

Uniden-America is only the distributor of Uniden scanners; not the manufacturer. They care about one thing only: SALES. Uniden-America is a sales subsidiary of the parent in Taiwan. Uniden-Taiwan makes a boatload of consumer electronic equipment, and they do not entertain frivlous non-sales related input from their field sales units. Uniden-Taiwan does not care about scanners, which comprise a tiny fraction of their output.

Radio Shack's scanners are made by GRE-Japan and Uniden-Taiwan. Just TRY talking to Radio Shack about what you want in a scanner. Radio Shack does not talk to people. Radio Shack knows what's best for you and you don't have to like it.

The process of getting them to issue a spec for new production based on what YOU want would involve YEARS of effort and then where will it go? Back to Uniden and GRE..... but it is not simple at all. GRE-Japan has used up about all the technology available to it - Uniden owns most of the high tech scanner patents these days. and for some reason, they do not use them.

AOR scanners are distributed by EDCO in the USA. You think THEY have a direct line to AOR's design and production crews? Ha ha ha. EDCO sells a wide line of stuff, and they sell what they are given to sell. They are not in the business of pissing off the goose that laid the golden egg.

In all cases, the USA distributors are here to SELL, SELL, SELL. If they get involved in messing with user groups, the parent orgnizations are likely to whop 'em up side the head for defocusing their resources and time to non-sales issues.

Your REAL homework will involve bypassing these US distributors who will only humor you at best, and tell you to get lost, at worst. Instead, forge a path direct to AOR, Uniden-Taiwan, and GRE-Japan. It won't hurt to learn Japanese and Chinese whilst you're at it.

Roll up your sleeves and do patent and technology studies. You will come to the grim realization that the 1985 PRO-2004 launched the hardware technology of today..... the family of scanners started by the PRO-2004, includes the PRO-2005, PRO-2006, PRO-43, PRO-2035, and

the PRO-2042. The differences among these five scanners largely consist of aesthetics, production tweaks, and minor tinkering with the designs. And.....FIRMWARE changes!!

For instance, the fundamental design of the old PRO-2004 is still the basis of the new PRO-2042. Ten years old! No substantial changes! The PRO-2004 used a mix of mostly wire-lead components and a little surface mount stuff. The PRO-2005 and 2006 used more surface mount; and the PRO-2035/2042 have more SMT devices still. The PRO-43 has a lot of SMT with the same basic design shrunk down to a handheld.

Mechanical aspects changed over the years. Looks changed. The designs of these five scanners are all about the same. The actual technology beteen the old PRO-2004 and the new PRO-2042 changed very little. The biggest changes were in aesthetics and FIRMWARE.

Uniden's evolutionary path is similar, though they radically redesign every couple of years for some odd reason, with the end result being a product that's about five years behind the times. Also, Uniden is a great one for packing everything onto a few chips and then using FIRMWARE to spell the differences from one scanner to the next. Most Uniden scanners are very "hollow" and empty inside. Even their better scanners are "flat-packed" with a minimum of hardware and a maximum of FIRMWARE. This tells you something about the value of human labor over there in the Orient..... FIRMWARE is cheap. Hardware is costly. So Uniden uses FIRMWARE to produce its glitz and glitter; lots of sizzle; very little steak.

In those cases where Uniden does excel, like the PRO-26 and BC-3000XLT (clones of each other), look at the cost! Geezus.....

I do not wish to discuss AOR..... they're out of it. You can't even get a decent service manual out of them. Tech support and parts support don't hold a candle to Tandy's and Uniden's.

Go for it, if you want. Form that User's Group. But I'll tell you right now, you have formidable obstacles to overcome...and you will find yourself all alone in a short time, even if you do get it off the ground. Hobbyists don't stick with this sort of thing very long. They have jobs, families, and other interests to consume their focus.

I'm saying it's been tried before, for one. And, two, if you try it "right", then be prepared for a many-year, costly effort....alone. The "players" in this market have woven a force shield that you will find impenetrable.....OR.....as an alternative, you MIGHT attract some marketing manager's attention enough to get you some pretty decals for your car, and maybe a certificate to hang on the wall in your shack.

Think it through.....all the way through. That's the sum and substance of what I'm saying. It isn't as simple as "starting" another User's Group....unless you'll be satisfied with decals, certificates, and maybe a logo coffee cup.

But if you REALLY want to make a change, then HERE is how you do it.

1. Write a technical specification for your scanner.

2. Write an RFQ (Request for Quotation) to manufacturer somewhere between 5,000 and 25,000 units. I think Uniden's minimum production run on anything is 5,000 units.

3. Send this RFQ to the Big Three (GRE, Uniden, and AOR). You might also try Maxon of Korea, though they're not into scanners yet that I know of.

4. Round up a few venture capitalists to fund the $2-million absolute minimum start-up cost, though the bankroll will eventually need to be $5-million before the first scanner is ever sold. It may not be until the 3rd production run before there are any profits.

5. SELL, SELL, SELL, SELL.....

It is as simple as that. Any other way is a crapshoot, because it involves "passing the buck". You let the buck stop with you and put up the cash, and you'll get the scanner of your dreams.

Would you consider trading the Icom 7000 to a Lowe 225. It has the keypad mod and FM\AM sync detector options and was just checked and aligned by a Lowe distributor.

Nick

>
>>>>>>>> Gosh Golly Gazzam .... do I put a _ OR - after

Gosh Golly or Gazzam?

I know what you infer. Same with me. I bend rules
all the time and like "piss in a toilet" they come after
me with all figments of imagination about my education.

What fun it is to just enjoy being able to "imagine" and
then USE the ideas you find workable as opposed to the
staid way others ritualisticly demand you utilize for just
their benefit.

Those who have ideas to express-bend rules. It's those
who read them is where the trouble of "reach" begins. That
is the major problem....makes one wish one was not so damn
creative and no one in group to apprecaite the wonderment
of that which was just "created"....

Bend The Rules....how else would we take a crap?

Does anyone have any freqs for the greenville sc area?? i am looking for the usual plus any off the wall stuff....i have a brother there who is a newbie with a 2004 and needs some freqs....i would sure appreciate it. i havent been able to be online much lately cuz of a lightning strike to my modem!!! thanks in advance.

5911. FS/FT: HF Scanning Receiver JRC NRD 525 Plus...

Newsgroup: rec.radio.scanner
Date: 1996-09-25 00:00:00 UTC
From: prografx@teleport.com
Message-ID: <52c3m3$fqr@nadine.teleport.com>
Source record: 222035

I have too many receivers and just don't have the time the listen as much as I once did, so it is with regret I must thin out my "collection".

I am selling my "baby", my JRC NRD-525 "DX Weapon" Communications Receiver. Here are some basic specs (from memory, but close)..

Basic Specifications

Tunes 100kHz to 34 Mhz (extremely stable, 10Hz resolution)

Modes: AM/FM/CW/USB/LSB/RTTY

200 Memories for storing favorite frequencies (which themselves can be tuned from .... a very valuable feature)

Memory scan and Limit Searching Scans.

Record Audio out, Recorder Control Output, and clock/timer for unattended operations to tape (Great for UTEs!).

Computer controllable via the included computer control interface and PC serial cable. (Several software packages included as well, this capability was a factory option nboard/cable added later).

Comes with original box, Owner's Manual, Factory Service Manual and optional computer control package (listed above). Receiver is very VERY clean and has a late serial number. I will also throw in a PC demodulator/software package for copying RTTY, Fax, and Morse Code from the receiver to the PC screen.

Asking $750 for the package, HOWEVER I would also consider a trade for a multi-band all-mode ham transceiver (6M/2M or 2M/440 preferred) of recent vintage.

E-Mail if interested.

Steve

5912. BC3000xlt USA V0.20 BUG Confirmed - FYI for you BC3000 owners. . .

Newsgroup: rec.radio.scanner
Date: 1996-09-25 00:00:00 UTC
From: Roy <roy@hylndr.enet.dec.com>
Message-ID: <01bbab1c$45235cc0$b4101e10@batmon.zko.dec.com>
Source record: 222036

FYI,

I purchased this radio a few weeks ago and did some testing and
found the following problem:

Having two frequencies such as 460.100 and 460.200 in the same
bank caused activity on 460.200 to be missed 90% of the time.
Modifiying one of the to be .105 , or .205 fixed the problem, but was
not a good solution since many other frequencies in other banks were
close to eachother if not closer. So not being sure if the radio was
picking up activity on such frequencies all or part of the time was a
problem as far as I was concerned.

The solution was to reverse the sort order. Do this by powering up with
SCAN button depressed. You get ON dir, then it resumes scanning.
You will see a small ^ on the display indicating sort direction. Hit Shift
(.)
down LMT (down button) , the arrow points down. At this point the
radio starts picking up activity on 460.200 every time there is activity,
not just some of the time.

This was tested a number of times and on TWO brand new BC3000XLT's.
They both exhibted the same exact problem, and were fixed by reveresing
the sort order.

It is my belief a bug with the firmware is causing the problem. David
Bernazzani (who I thank for suggesting reversing the sort order), made
a good point; If you seek in one direction on your car radio, you may
find it picks up stations seeking in the opposite direction that you may
not have found origionaly.

Whatever the logic - I suggest rev. the sort order so that your sure not
to miss anything! The only thing you have to live with is the little down
arrow on the display.

Happy scanning,
-Roy Golisano-

Except for the $150 Vidcraft(?) set, all of those transmitters are tuned circuit L-C oscillators running around 910MHz (sound familiar?). You can tune them to transmit anywhere you want.

Keep in mind they are drifty, fairly noisy and not well filtered. The construction used in most of them is not exactly stripline and groundplanes!

Isn't there a regulation for frequency stability and signal fidelity in amateur transmissions?

You would be better off designing/building/buying something designed for ATV.

> The point is probably moot, though, because I don't think we have any
> ATV repeaters near my home.

They simply would not have enough power to reach the repeater. Changing the collector resistor may not yield much.

If you have the skill to design and build a 900MHz PA, why not go a step further and build a good, clean, stable 900MHz exciter.

If you are going to spend the money on a 900MHz beam and 900MHz power amps, why not use a good, reliable transmitter...Don't embarrass yourself "on the air" (*IF* you even get that far!)

Hi Bill,

I've heard nothing - yet but I'll keep monitoring here in Central Jersey. BTW, you only mention in the clr, I guess you've heard something other than clr voice in the past?

The only UHF usage of late was 345.500 for AF1. This time it was only the carrier I heard. I have heard conversations in the past. Several conversations on this freq at one time.

Sub channels of sorts. I've heard several explanations on what is being done. I did hear clr voice USSS on 164.800, Philly yesterday. Did you copy any activity?

Regards,
LGS

I live in Escondido, CA and monitor MILAIR in this area. My main "weapon" is a Bearcat 8500xlt with about 350 freqs in memory for MILAIR. I got most of thease from the SoCal ScanFan book and think its the best local listing. Because most of my 350 freqs are NOT on most of the time I have a tape recorder plugged into the scanner and playback the tape once a day.

I never have had my radio toys checked, but once a CATV converter
was checked. I couldn't show it worked standing there, especially
without AC. Also, one terminal only in the Buffalo airport always had
to open and look at every roll of film I had. One idiot even wanted
me to open the camera with film in it.

> You will see a small ^ on the display indicating sort direction. Hit Shift

Ahh.. I'm glad the reverse sort worked for you. Unfortunately, for the priority scan problems I found earlier in the year, a quick check revealed that they did not fix that problem.

Also, be aware that other combinations of frequencies could cause the "reverse" sort to exhibit the problem anyway. I don't know as I couldn't reproduce your exact problem due to those frequencies being inactive in my area. I tried other "close" frequencies, but they worked fine for me. It's kind of scary not to be able to predict what combinations will fail.

Also, in retesting to see if reversing the sort order fixed my priority failure, I used the same setup I reported in an earlier post (which changed priority from 181 to 191) but I didn't have activity on the 191 priority channel so I had to substitute NOAA weather (constant broadcast) and it worked perfectly! This continues to leads me to believe it is related to all the other frequencies you have programmed for a bank... many combinations work fine, but some fail. When I switched the priority in bank 9 from 161 to 162, the priority failure occurred again just as I had seen it months before... where it would never detect priority on 191, just 162. Just changing from P162 back to P161 fixed the problem. I didn't want to run the experiment of putting P177 and P191 which was the combination that (with the frequencies I was using at the time) caused the "priority scan" to scan bizarre channel numbers (425, 500, characters showed in the display which were not numerals - more like random segments). Again, it appears to be some sort of problem with mixtures of priority and frequencies within banks. I have *never* seen a problem while leaving the priority on the first channel of any bank or not using the priority scanning feature. Below is the latest test I ran. I tried a couple of NOAA weather frequencies in P191 which all failed to be detected on a priority scan. (again V0.20 USA firmware).

161 146.5200

Very sorry, I meant to send this small set of utilities to break large files into smaller ones to a friend and clicked the wrong box and sent it to this group instead. Very sorry for the inconvenience (unless you were *actually* looking for a DOS program to break large files into smaller chunks in rec.radio.scanner ;)

Oh... just so I don't follow up a valueless posting with another, a quick obligatory scanner observation follows:

I was thinking tonight how amazed I was at my used Pro62's batter life. I use Rayovac renewal batteries and seem to get 20+ hours on them and then just pop them in the recharger for 6 hours to get back near full charge. Three cycles so far and no obvious wear on the battery life. Seems like a bargain (about $8 for 6 batteries) compared to my beloved BC3000 with 6 hour battery life on a $35 battery (although is can probably be recharged many many more times).

Sorry again and take care,

Dave Bernazzani

Goes along with my theory about traffic lights after midnight. I apply the "If a tree falls in the woods and there's nobody there to hear it fall, does it make a sound?" principle. By that I mean, if it's after midnight and there's nobody else around (most importantly there's not a cop nearby), and you run the light, does anyone see you run the light?

How do you know the licensee is interfering with channel 19?

Did you ever stop to think that the cable system might be so
poorly designed as to allow outside signals to enter it? Or
that your own installation might be so poorly connected as to
permit signals to enter it?

Here are some frequncies from the SL area -most were given to me by a police officer

SLC 151.3250
SLC 460.1000 Channel 1
SLC 460.2000 Channel 2 (TAC)
SLC 460.3000 Channel 3
Sandy 154.8300 Channel 1
Sandy 155.9550 Channel 2 (TAC>
SL County 154.6500
SL COunty 153.3700
U of U Police 154.7250

These are all police frequencies. Hope the help

> antenna to your feedline to your radio. Geeez Bill, what are you telling
> these people?

That is EXACTLY correct. Using rg-59 will immediately give you a 2:1
SWR
which will create signal loss because it is 75 ohm rather than 50 like
everyone uses. Then rg-59 IS NOT uv resistant so it will
become even more lossy as time progresses if it is used outside or
exposed
to sunlight. 9913 is also not uv resistant so even though it is the
correct
impedence it still has the same problem of becomming lossy like rg-59.

The only coax that is uv resistant that I am aware of is rg-213 & 214.

BTW- Tyler, you forgot to mention that Bill also calls himself a
Chemical Engineer.

95.603 Type acceptance or certification required.

(d) Each FRS unit (a transmitter that operates or is intended to operate in the FRS) must be certified for use in the FRS in accordance with Subpart J of Part 2 of this chapter.

6. Section 95.605 is revised to read as follows:

95.605 Type acceptance and certification procedures.

Any entity must request type acceptance for its transmitter when the transmitter is used in the GMRS. R/C or CB Radio Service, or IVDS following the procedures in Part 2 of this chapter. Any entity must request certification for its transmitter when the transmitter is used in the FRS following the procedures in Subpart J of Part 2 of this chapter.

7. Sections 95.627 through 95.669 are redesignated as 95.629 through 95.671 and a new Section 95.627 is added to read as follows:

95.627 FRS unit channel frequencies.

(a) The FRS unit channel frequencies are:

Channel No. / (MHz)
1. 462.5625
2. 462.5875
3. 462.6125
4. 462.6375
5. 462.6625
6. 462.6875
7. 462.7125
8. 467.5625
9. 467.5875
10. 467.6125
11. 467.6375
12. 467.6625
13. 467.6875
14. 467.7125

Hello,

I just got my hands on a new ham that scans all the freqs I'm interested in, so I don't have much use for my PRO-60 anymore. It's in excellent condition, (has less than 10 hours on it), and I still have the box, manuals, etc. Here's the features:

Total coverage from 30mhz-512, 760-824, 849-869, 894-999.9875.
(vhf hi, low, and uhf)
Triple conversion.
200 channel (scanable), plus 10 extra storage channels.
AM, FM, WFM.
"Limited search" feature- pick two freqs and scan everything in between.
Can charge NiCd batteries.
Keylock
"back-lit" LCD

Also included:

9 volt wall adapter
Telescoping (not the factory) antenna

Asking $245, buyer pays shipping.

> Hi all
>
>
> My question to the group mind is this: When I try to transmit simplex
> on any UHF frequency at 4.0 watts or above my Saber's display "recycles"

I have seen Sabers do weird things at the higher power levels... sometimes
it
is dependent on the antenna. My guess is either there is a power supply
related
issue causing problems or indeed there is RF getting back to some sensitive
high impedance circuit (maybe the CPU reset line?).

Unless you have the manual and plenty of time and are comfortable working
with surface mount, forget about it.

> It stands to reason that if the CPU was bad the radio would be dead or
intermittent.

Well, it is intermittent (under high power xmit conditions...

> Works great, at 4 watts.
>

The extra little bit of power won't do that much for you. The effective
usefulness of
power is logarythmic rather than linear, i.e., going from 2.5 to 5 Watts
will not double
your range, just increase it a little bit. Think of it (in very simplistic
terms) as a transmitter
then a path loss then a receiver. The path loss can be over 100 dB and the
transmission
is fine. Now you double your power, adding 3 dB, and you see that the
difference can be
small. This holds up in real life... a friend once had a blown output
stage in his Wilson
HT on 2m. He was complaining that the performance was not too great, but
certainly
usable. We measured an output of about 20 mW at the antenna.

So my bottom line advice is to back off the power until the radio is rock
solid. It is not
worth much to have a watt or two more, especially if it makes the radio
unreliable. As a

bonus, you will get extended battery run time (especially if you transmit a lot, or if you
might need to transmit a lot).

...Peter

A few times I traveled on business (construction) and my associates and I carried portables. Security just looked at them (remember that they had to manually carry them around the metal detector gate) and didn't even ask, ever, not even once, for us to demonstrate their functionality.

I would have certainly felt better if they at least told us to make sure to not
use them on the plane!

Radio Shack Weather Station WX 200

Has anyone seen the new weather station that Radio Shack is offering?
I guess they are trying to compete with the Davis Instruments.
The new catalog says that they developed with Accu Weather a unit
that is affordable.
From what I see this deal sounds to good to be true (but I hope it
is!)
So for 299.99 you get all these features:
temperature
relative humidity
dew point
barometric pressure
wind speed/direction
wind chill rainfall and rates
clock
Records highs and lows for all measurements also has alarms for highs
and lows.
Has all the cables, outdoor rain gauge, wind sensor, and temp/humidty
sensor.Needs 8 AA batteries for backup. Run on AC.

**PLUS it comes with the software to run on a IBM compatible! to keep
track of all readings!
And of course the software offers to link you with Accu Weather on
line (for a small fee).
Now this unit is not available until Oct 30 1996 (yea right)

SO if anyone has the inside scoop on this please drop me some e-mail.

fxmurphy@voicenet.com
The next time travlers meeting will be last week

The City of San Francisco in it's infinite PC-ness has delayed spending millions of $$$ to upgrade it's antiquated police radio system (a combination of low band base to car and UHF portables).

Why? Well it seems a while back the city powers that be voted to not have any business dealings with the country of Burma because of their "human rights violations". Wouldn't ya know it, the two bidding companies - Motorola and Ericsson/GE, both have dealings with Burma. Oh well.

Since the upgrade would probably include scanner unfriendly things like: trunking, digital or what ever bill of goods could be pushed on the city, this is good thing - for now.

Once AGAIN, your facts are WRONG! Today, the Canadian Dollar is worth
about 73 cents American. Not quite 50%.

The reason any Canadian works in the U.S., is the fact that due to the
higher population, there is more opportunity for jobs, and therefore more
jobs available (duh). If you were unemployed (if you're not already), and
a company in Canada offered you a job, if you had any brains, you'd take
it. Think about it.

Tiny? Little? country. And AGAIN the facts are WRONG, in reality it
is the LARGEST country in the world (well, depending what you consider
countries left of the former U.S.S.R.) MUCH larger than the U.S. We
just don't have to squeeze five zillion people into one square mile, and
hope they all act like humans and not try to exterminate each other.

That isn't exactly true. Name one old-time protocol that was
proprietary. Copyrights are never handed over to the public domain by
virtue of theft. You may be thinking of trademark issues, which
certainly is a different story altogether.

Transmission protocols are either like CW, RTTY, FAX, etc, and were
never proprietary, or they're like Z-modem and the many flavors of FSK
which have always been protected by law and even more so now, thanks
to the ECPA of 1986.

Excuse yourself, but in the course of conversational dialog, the "rules" of grammer are easily and legitimately bent.....especially when using the vernacular. As a professional writer, I will not only bend those rules from time to time, but I will sometimes amend them or even create new ones. Those who don't like it are, of course, free to lump it.

>>>>>>>If you are inferring that my work is my Life....well, that's got a
> Actually, he's "implying" that your work is your life. YOU infer it.

You 'infer' while I deduce..... Understand THAT?

>>>As for titles, sometimes I am CEO. Sometimes CIO. Sometimes CFO.
>Sometimes administrator. Sometimes assembler. Sometimes designer.
>Sometimes drafter. Sometimes engineer. Sometimes floor scrubber and
>bottle washer. Titles are for those who don't know what they are supposed
>to be doing.

> Every one of the aforementioned "titles" should have been seperated by a
>hyphen or, in the best of worlds, a comma. EXAMPLES OF CORRECT USAGE:
>"Sometimes-engineer. Sometimes-floor-scrubber-and-bottle-washer."

Nope. Maybe you would do that. I would not. Unless I were writing a book or some form of official manuscript, in which case I would almost certainly employ a different set of rules. This, however, is a conversational forum ..... so see my first paragraph above.

> Ordinarily, this type of illiterate crap simply washes over me on the
>web. However, this pseudo-intellectual claims to have engineering degrees
>across the board, so I have to call his hand. He appears to be a bit
>sloppy in his English and grammar, and I'd like him to respond to this
>issue.

I did. Reread all the above. So "call my hand some more", if you feel so inclined. Brass tacks facts are that there are many levels of language "rules" now. Different situations call for different

applications of those "rules", and it is perfectly acceptable to be loose and comfortable in conversation, which is exactly what we have in this fine forum.

Refer to the grammar chackers that come with all the better word processors and desktop publishing programs now. They all have three or more levels of "rules" to apply, depending.....

Now would you like to talk scanners and scanning, perchance or happenstance? Methinks you're not all that interested.....

I assume this is with Win 3.1. (since GPF errors are rare with win95)

Make sure your config.sys has the following:
files = 45 (or more)
stacks = 9,256
shell=c:\dos\command.com c:\dos\ /p/e:2048

If you are running smartdrive then you also need:
buffers = 15,0 (or more)
If you are not running smartdrive then you also need:
buffers = 45

You also need to (at least) have 8 MB of ram, a virtual
memory PERMANENT file of at least 3 times the amount of ram.

If you are running QEMM then make sure you ARE NOT
in "stealth mode".

Do a "mem" command from dos & make sure you have at least
530k of memory in "largest executable program size" in the
lower right hand corner after typing "mem". If you do not
have at least 530K then try running "memmaker" (unless you
are running QEMM).

If no resolve then run scandisk (chkdsk/f if in dos 6.0 or
earlier) & then run defrag.

If that does not solve it then write back & we'll
go from there.

Good luck.

The only problem with monitoring the shuttle on ham radio is that hams like to talk too much. Scan around and I bet you will find something outside the ham band that has a cleaner sound and most of all it is uniterupted.

The lucky ones live within 10 miles of a NASA space center. You can hear the low power broadcasts via microwave. Here in the Antelope Valley I can monitor the shuttle via 22 different modes. For the AV the best is from Edwards AFB on 169.400. LA AFB also has a UHF broadcasts that is pretty good.

In short if you want the best coverage then go to the source. The same place that hams get a feed. The best part is some dumb ass will not start talking right in the middle of something interesting.

Hi! I need to move my BC2500XLT; I've had a lot of lookers, but no buyers. I can't consider a trade right now.

The 2500XLT is a 400 channel scanner, covering (almost continuously) 25 MHz - 1300 MHz (cellular is unblocked). It has a turbo mode, which scans 100 ch./sec.

The unit is in excellent condition, and includes the box, manual, leather case, a universal DC charger, and a 2nd, additional battery pack which needs rebuilding.

$225, + shipping.

Please drop me a note ...

True in a sense. But it also helps if you have some smarts about it and don't
tip your hand. How do you think they catch most cable pirates? It's either
through a friend (or ex-friend actually) that turns them in our they're
stupid enough to believe the free offers that cable providers run.

Umm.. If you're a ham, and you use it, it's ATV!
Welcome! Down East Microwave has some relatively cheap amps that
will let you go to 60W output, and you can replace the RX input
with a low noise MAR amplifier as just about a drop-in.

I've gotten about 1/8-1/4 mile with a pair using MAR-8 for output amp
and MAR-6 for input pre-amp. A cellular band notch filter is also a
good idea since just about everyone these days is close to a cell site.
That will help the noise on the rx quite a bit.

5999. Decoding FSK Data - Can I ?

Newsgroup: rec.radio.scanner
Date: 1996-09-26 00:00:00 UTC
From: michael@tbsa.com.au
Message-ID: <52d2fj$o3i@news.tbsa.com.au>
Source record: 221939

I am trying to decode FSK using my scanner and a P.C...

I have tried numerous things including using a P.D. Pager decoder interface that takes the FSK and fed that into both a terminal program and an RS232 monitoring program and came up with bugger all.

I have also used the JVFAX decoder interface with the same results.

The signal I want is nothing special, just (A)FSK and the data is not encrypted in anyway.

Can someone suggest a solution to this, apart from buying a mega-expensive commercial decoder.

Any help would be appreciated

Thanks in advance

Date: 1996-09-26 00:00:00 UTC
From: aa186@freenet.akron.oh.us
Message-ID: <DyBFJA.7ML@freenet.akron.oh.us>
Source record: 221972

For Sale:
Radio Shack Pro 2030 scanner (base)

* 80 channels
* limit search, hyperscan, adjustable speeds for search/scan (12/50 cps), 10 monitor memories, direct search, works with the 66-80 MHz soft mod (I tried it), built in weather freqs.; line out for external speaker; BNC jack for external antenna. I THINK unit can be used in a car as a mobile -- I will have to check.

* comes with adapter, 3 section whip antenna, box, manual and packaging. all of which are in exc. cond.

* Unit is in perfect cond. (non-smoker). I repackaged it like it was when I bought it.

* bought it new A WEEK AGO and got bored with it (yes, new) but I had to bust my hump to track one down. I think I got the last one in the state.

* does not work with the cell mod (too new), but DOES get ok quality cell images bet. 898-915 Mhz.

My favorite feature of this unit is the fast search/scan speed, especially when searching for new frequencies.

You send the check, I'll send the unit. Sorry, no cod's.
Price: $70 shipped continental U.S.

Please send all replies to:
aa186@acorn.net

Thanks.
Mike

ammcap@aol.com (AMMCAP) wrote:

> Does anyone have any experience with the new Pro 2045? How sensitive?
>Noise rejection? Speaker volume and quality? Etc? Thanks

I've had one for about a month and I'm pleased with it. I use it with a window mounted vhf/uhf whip antenna and it pulls in stations as far away as 50-75 miles on a regular basis. Noise rejection seems to be excellent. Speaker volume and audio quality is fine. All in all a pretty decent scanner. This one has the auto store feature that has been improved over the worthless one in the 2035. That scanner wouldn't discriminate between a previously stored freq and a new one. Theoretically it could store the same freq in every channel. Not so in the 2045, which checks to see whether the freq is already in memory. A nice feature. Recommended. Regards, Barry, WA2KLS

It's a FACT, Jay! There was an article in last Sunday's Orlando Sentinel which examined the changing attitudes towards Affirmative Action as it relates to college admissions. (Public colleges, of course, have this nasty habit of DISCRIMINATING against white and Asian students by providing set-asides for minority students with LOWER test scores!)

The article contained several tables, comparing various groups of Asian, white, black, and Hispanic SAT scores of entering Freshmen.

Guess what? The BLACK and HISPANIC scores were, in all cases, a full 25-30% LOWER than the WHITE and ASIAN students' scores.

6013. Re: Travel with toys (electronics)

Newsgroup: rec.radio.scanner
Date: 1996-09-26 00:00:00 UTC
From: jamoran@indirect.com
Message-ID: <52d0il$ipj@globe.indirect.com>
Source record: 221981
Cross-posted to: rec.travel.air,alt.radio.scanner,rec.radio.scanner,rec.radio.shortwave,rec.radio.amateur.misc,rec.aviation.piloting

Contrary to the statement that follows....Scanners Emit very LITTLE RFI (Radio Frequency Interferance) when you compare them to the RFI emitted by computers....this computer I am working on here is VERY Noisy...I can sit the scanner next to it or near it..in the same room or in some cases, an adjacent room and hear processor noise. The processor noise varries in frequency and amplitude depending on what the processor is currently doing. Aircraft communications and beacons are AM modulated.....RFI Noise is much more of a problem on Amplitude Modulation (AM) than it is on Frequency Modulation (FM) frequencies.

I too have had security agents stop me and look at my toys..either the Shortwave. Scanner, or my newest, a Thermometer/hygrometer..or temperature/humidity pen....This gadget fits in my pocket and I frequently carry it with me!

having hi-tech toys has never really been a problem on Domestic US flights..just turn on the radio or the laptop..if the radio is in a briefcase..no one ever says anything...only hapened to me once...Why did my Sony-2010 have 2 sets of batteries....had to explain one set was for the radio and the other was for the memory, computer, and clock....

International airports, can be a different animal...they may want to sniff each device, scanner, radio, tape player, camera,,etc for nitrates..this won't get everything but it's a way of screening out commonly used or easily detectable explosives.

you can use a scanner on an aircraft without any adverse effects!!

Sound like the signes of the times to me. Anyone should realize that possession of a thing that is defined as illegal is a crime, whether or not you get caught.

Those who make the point about not getting caught, therefor not having committed a crime, are in the wrong. Eventually, they will slip up and get caught.

6018. Re: Civil Aero Band Frequency

Newsgroup: rec.radio.scanner
Date: 1996-09-26 00:00:00 UTC
From: len.anderson@mogur.com
Message-ID: <9609260031032821@mogur.com>
Source record: 221986

HGPJ>From: hpeach@pop.uky.edu (Harold G. Peach, Jr.)
HGPJ>Subject: Civil Aero Band Frequency Increments?

HGPJ>It is my understanding that frequencies in the civil aero band are
HGPJ>allocated in 25 kHz increments (i.e., 119.1, 119.125, 119.150 ...
HGPJ>etc.). However, I have notcied that pilots departing our local
HGPJ>airport are instructed to contact the ARTCC on 126.37 instead of
HGPJ>126.375.

HGPJ>My question: When a pilot switches to 126.37 on his aircraft radio is
HGPJ>the radio actually transmitting on 126.370 or 126.375? I know that
HGPJ>from a practical standpoint this has no effect on my ability to
HGPJ>receive the transmission, but I am confused by their tendency to drop
HGPJ>the 5 kHz.

126.375

Chalk it up to verbal shorthand. There is no 5 KHz increment selector
in aircraft radios that I've seen (could be on some large aircraft but
general aviation radios have very limited panel space and is a two-
knob arrangement: 1 MHz increment selector, 50 or 25 KHz increment
selector.

HGPJ>Also, if the radios only tune in 10 kHz increments, can the pilot
HGPJ>switch to a non-standard frequency such as 126.11?

Generally, no; haven't seen that any ground or air station is
on that frequency increment. I've not seen any that tune finer than 25
KHz but I've not strapped on an airplane in a while, either. :)

A look at the sectional and local aeronautical charts reproduced in
Flight Simulator will show the frequencies...but I don't remember if
there is a legend box available such as on the back of aero charts;
some of the shorthand and jargon is strange to the unfamiliar.

It could be but I doubt it. A GPF is always memory related.
However, it is possible that another driver could be causeing
a memory conflict. But that is still unlikely because if
that was the case (a driver) then the problem would usually
be consistant.

The only time I tune in 448.500 is when the shuttle is up and I've
never heard a HAM interupt it. Maybe I've just lucked out so far.
I'll punch that 169.400 freq in to see if I can pick it up in Simi.
That's pretty far from me and a few hills to boot so I doubt I can
pick it up, but I hope I can!

BTW: For full enjoyment of shuttle listening, open your web browser
to the shuttle NASA TV site and listen to it on your scanner.
If my memory serves me correctly, it's at http://shuttle.nasa.gov

Listening to the deorbit burn as I type this :)

Thanks for the info Jeff!

"Trident" is the pseudo-brand name used by ACE Communications for radios
formerly distributed through them by AOR. One cannot make a blanket
statement about these radios ... often they come from different
manufacturers. Some are excellent but quirky, some are mediocre, some are
awful.

Source record: 221999
Cross-posted to: alt.radio.scanner,rec.radio.scanner

There is also a 220 freq in the L.A. area which does a pretty good job of re-broadcasting the shuttle. For a long time there was 145.460, but a move of the repeater made it a little hard to listen to. I believe that the 220 freq is in the 224-225 range although I forgot the actual freq.

I really cant stand it when those selfish hams think that they have to have a conversation over the frequency when it is broadcasting the shuttle. After all, they only have 100 or so 440 repeaters that they could use in the L.A. area.....Just goes to show who is a loser and who is not.

6032. FS: New UBC3000XLT

Newsgroup: rec.radio.scanner
Date: 1996-09-26 00:00:00 UTC
From: malex@kersur.net

Source record: 222000

I bought a Uniden UBC3000XLT a couple of months ago, thinking that I what I *needed* was another handheld. Actually, what I really need is another base unit. Ergo, Iï¿½d like to sell it only because I canï¿½t afford to keep it and buy another scanner. I paid $400 for it and Iï¿½d like to sell it for $350. It's brand new and comes with all of the original accessories, manual, box and an AC adapter, which I bought from Radio Shack for about $10. Iï¿½ll pay shipping via US Post. For added protection, you can pay by credit card.

Features:

400 channels in 20 banks
25 MHz to 1.3 GHz scanning range (no gaps where it matters)
100 freqs-per-second scan
300 freqs-per-second search (in 5 KHz steps)
AM/FM/WFM
Auto store, auto search, data skip, etc. etc. etc.

Sure. But before you make it permanent, consider using a switch to
turn the BEEP on and off. Believe it or not, it serves a very useful
function. But anyway.............

Clip an exposed lead of D-35. Use an SPST switch between the cuts if
you'd like to have the option of On/Off.

I have a quick question:

If you take a scanner on a plane with you (if you can, legally), will it interfere with the commnuications devices of the pilots or the functionings of the plane? Can one listen to the pilot talking to the air tower?

I can already hear the plane and the air tower from on the ground, I was just wondering if it's possible to hear it from inside the plane.

Please post reply.

Andy (andy@buffnet.net) had written:
| I never have had my radio toys checked, but once a CATV converter
| was checked.

I've been pretty lucky with my radio gear and tape recorders over the years when going through airport security. The only time I have run into a problem was when I had packed a Hallmark Keepsakes Star Trek ornament with a talking chip in my garment bag. That was at Chicago Midway, and the security guy opened up the box when the X-ray showed a big metal object. When he saw what it was, he started saying "To boldly go where no man has gone before...." in a W.C. Fields-like voice.
OK, so I guess you had to be there.

Mark

If you are using this to scan a range of frequencies it really isn't
going to matter because your receiver will never see 50 ohms
over a very wide spectrum anyway. This would hold true if you are
monitoring a very small slice of spectrum but as soon as you
start tuning around that magical 50 ohms is gone. This shows up
quite clearly when you use an antenna analyzer and tune just a
MHZ or two away from the antennas designed frequency.

>Then rg-59 IS NOT uv resistant so it will

>(800), 900 (900)... We're looking at 4+ antennas? Ever hear of a dual
>band antenna?

One local agency I monitor has a UHF (460MHz) tactical frequency. To
be able to monitor this I need a UHF Yagi & a Hamtronics LN Pre-amp.

I use a deidcated scanner to do this. It would be nice to be able to
have multiple ports that BAND SPECIFIC antennas could be connected to.
Like one for low band etc., as many COMMERCIAL antennas have much
better performance than a scaner antenna.

About 4 connectors would be nice.

>reciever? What we say and what we purchase should drive the market.

First:

A **PORTABLE** ala BC-200XLT with CTCSS & DPL! PLEASE!

Second:

A mobile/base w/:

1) Computer Interface to control ALL functions
2) Discriminator Output for various decoders from EMWIN/WEFAX/ACARS
etc. to whatever elese comes along.
3) 26MHz to 1.0 Ghz Coverage (I don't care about cellular, so I am not
going to wage that war to get it back.)
4) CTCSS & **DPL**
5) Multiple Priority's & Levels
6) 2 Tone/DTMF/5-6 Tone Pager Decode with a Contact output. This would
allow FD's to have scanners at FF res. with the ability to decode when
their agency was activated. A contact would allow for a siren, light,
or whatever to be activated.
7) NOAA WX Alert (OLD)& NOAA WSAME Alert (New) **WITHOUT** it being a
choice between WX alert and scanning. Alarms should be a visible
indicator, audible, and/or none.
8) Programmable attenuation per channel.
9) 4-5 Programmble antenna ports.
10) EF Johnson LTR following. GE & Motorola are out, but EFJ is
willing to license their protocol to about anyone who puts the bucks
up.
11) Line Level output.
12) Triple Conversion
13) "COMMERCIAL" quality IF Filtering
13) Front End RF Filter
14) AM/FM/WFM/SSB modes

knightblu@aol.com (Knight Blu) wrote:

>Is the RS2035 modifyable for cellular

No. Not in any conventional sense. There are three ways to sort of
do it, none of which are very good answers to the US hobbyist.

1. Replace the CPU with a European CPU
2. Replace the Logic/Display board with a European version
3. Perform the "virtual downconverter" mod.

(1) is hairy as hell, but cheaper than (2). (2) is expensive, but
easier. Both (1) and (2) yield cellular.....in 12.5 kHz steps.

(3) is grossly inferior and does not result in availability of but
just portions of the cellular bands, and there is a terribly confusing
correlation between the readout and the actual frequency.

> and also what exactly is the difference between it and the RS2006?

Technical differences are few. Major differences are in aesthetics,
firware, external controls & firmware-controlled functions.

Message-ID: <52gtc8$p25@news2.ptd.net>
Source record: 221875
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I am trying to perform the widely published PRO-2021 mod to enable 800MHz reception, and I am having trouble.

I followed the instructions (Clip D44, solder 10K resistor from IC-8 pin13 to R113) but I cannot pick up a known signal.

The CPU accepts the 800MHz input, but it seems like the RF front end is not enabled to receive 800 MHz.

I must have done something wrong because according to everything I've read, the search mode won't work with 800MHz frequencies, and mine is working.

Any ideas? Anyone done this mod with any success?

->I just got the 6th edition of the NYC/NJ Scanner Master, it's GREAT!
->However, I have a 5th edition if anyone wants it. Just pay the postage,5
->or 6 bucks should do it. Otherwise it's hitting the trash can in a few
->days.

Your offer to sell the 5th. Ed. for postage only is actually quite a fair
and generous offer. If i did'nt already have one I'd but it myself.
However, should anyone fail to take you up on your offer, you might want
to seriously reconsider trashing the book. Just because some frequencies
change or are no longer used by the same agency (or at least listed as such)
does not nessecarily mean that they have "gone away". They could get picked
up or transfered elsewhere. Sometimes the older guides can be useful in helping
you track down the new user, as you will have a clue to the former licensee
etc. I can almost guarantee that there will come a time in the future where
you will wish you still had the "old book" to refer back to. IMHO only.
Regards,
Phil
Oh crap, second line, word "but" should read "buy". But you already figured
that out.

Hi guys,

I didn't see the original post on this, so I have a question.....
What does this thread have to do with scanning?
Just wondering,

Chris

Hi Charles,

you can find a schedule of events for the Albuquerque Balloon Festival
at:

http://www.rt66.com/aibf/events96.htm

It makes no mention of the Thunderbirds performing there.

I think the Thunderbirds are flying at the Kirtland Open House,
at Kirtland AFB, NM on 10/05/96.

You can find a list a frequencies and schedule for the Thunderbirds at:

http://www.grove.net/mttbirds.html#freq

Scanners are absolutely legal within the state of Georgia.
There are no restrictions in their use in your car, boat,
P/U truck, etc.

If you need any frequencies for the state, call:
(770-) 942-1089
This is the Southeast Signals Intelligence Group BBS
(No relation to Signal Intelligence Company out of
New York and their office somewhere in California)

At least overnight (it's happened a few times to me). -jqt

- -
- - - - - - -

*** Bob's Tip of the Month ***

(from
Monitoring Times, January 1993, Dial 1-800-438-8155, Great Magazine!)

Realistic (R) PRO-39 Cellular Restoration (Page 107)

[with a few c
omments added by someone who witnessed such restoration -jqt]

The
recently released PRO-39 handheld scanner from Realistic (R)
is a fine
performer, but its 800 MHz range is interrupted by the
factory censoring of
cellular frequency coverage. Long-time MT
supporter Larry W
iland of Youngstown, Ohio, would like to share the
simple fix. Remember,
however, that it is unlawful to listen to
cellular phone calls.

(NOTE: These procedures may void your warranty. Do not attempt
them unless
you are familiar with small component soldering.
Monitoring T
imes accepts no responsibility for damages resulting from
attempting this
modification.)

TOOLS NEEDED: Fine-tipped soldering iron, desoldering
wick,
small Philips screwdriver, long-nosed pliers, rosin-core solder.

(1) [Turn off your radio. Removing the batteries when the radio i
s ON can
erase the memory! -jqt] Remove the battery door, holder and
[battery
pack] from the bottom of the radio.

(2) Remove the four screws
from the back of the scanner and carefully lift
the back off.

(3) Unplug
the two wiring harnesses at their connectors and remove the six

bright colored screws [that hold] the circuit board in place. Unsolder

the ground wire from the lower right corner of the circuit board.
Unsolder
the two wire connections from the BNC antenna connector at the
board.
Carefully lift the board (grasping it near the Molex connector)

and set it aside.

(4) Remove the two bright colored screws from the next
circuit board.
Carefully unplug the two-wire connector [and remove the

board, as I
recall -jqt]. Unsolder and lift the rectangular metal shield
exposing
the diodes.

(5) Carefully unsolder and remove d
iode D6 only; this will restore the
missing cellular frequencies which can
be searched in appropriate
30 kHz steps.

This completes the
cellular restoration. Reverse all procedures
to reassemble the radio and
test it by entering any frequency between
869-894 MHz. [If
you are as lucky as I was, the memory will still
contain your other
frequencies! -jqt]

Curious about the other diodes? D4 would enable
68-88 MHz
coverage, but deletes 30-54 MHz; D5 (present) allows 800 MHz
band
operation; and D7 would make cellular spacing 12.5 kHz (inc
orrect).

Thanks Larry!

> about double (or more) of that.

When I connect any of my 3 antennas I use on 2 meters to my antenna
analyzer
the impedance will begin drastic swings as soon an you tune a MHz or
two. Not
just a swing up but up and down. It seems to me we are debating if we
should match the
cable to the receiver or the cable to the antenna. The receiver will
look for 50 ohms
and with 75 ohm cable there will be a slight mismatch. If you run 50
ohm cable, the
receiver cable match will good but the cable antenna will always be
mismatched to a degree.
If you always wanted a low SWR and a 50 impedance you would have to
have
multiple antennas cut a MHZ or two apart. There is no way you will keep
50 ohms throughout a receiving system unless you stay on one frequency.
At least that is the way I understand it.

Too bad. Those of us who are "in the know" do it all the time. Saves
the time and hassle of trying to explain things to the "X-ray droid" who
often doesn't know the difference between a transceiver and a receiver,
or a cell phone and a 2-meter handheld.

Modification to restore cellular frequencies in the Radio Shack PRO-2030

Scanner.

This mod is essentially the same as the PRO2026 except the
location of the
jumper is slightly different.

1. Remove power
cable.
2. Turn unit upside down.
3. Remove five
(5) recessed screws from bottom panel.
4. Carefully remove bottom
panel.
5. With display panel facing you, locate the jumper marked L201 on
the
circuit board attached to the display. It will be about

2" in from the from and 2" in from the right side. It will loo
k
like a RF coil.
6. Cut the jumper marked L201.
7.
Reinstall the bottom and reconnect power. Scanner is ready for use.
8.
Cellular frequencies are now restored with 30 Khz channel spacing.

Please note: I picked up this mod from the FIDO net. I have never

completed the mod myself because I own the 2006. But I do have the

service manual and this is the diode that locks out the cellular band.

Even the specs show this diode connected to pin 10 of the microprocessor.

This pin is the STRAP OPTION CELLULAR SKIP. Too easy!

C'mon Bill...don't be a liar.

There are two posts that go around every once-in-awhile for this Uniden manufactured scanner. Methinks there may even be one on yourHertzian BBS ((619) 578-9247 5pm to 1pm western time zone)!

Oh, don't worry about flaming me just to tell me that "you wanted you open his eyes." You just made him (and others) turn a deaf ear.

I already sent him the information that he wanted. Here it is for those that want it anyway (from the service manual and common knowledge):

Well, first make sure your fcc id does not end with an 'A'.

EX: FCC ID 20-407A

(or something like that)

or: look at the model number...it should say 20-407, not 20-407A.

If you have an 'A' code, then you can't get a cell mod.

If you have the regular one, then open it up using the five screws, and remove the cover. Look for the small board attached to the keyboard PCB. There should be a small RF loop labeled 'L201". You can either clip this or desolder it...it is up to you.

Cell coverage is complete.

The next mod is for all 2030s. This will clear some or all of your programmed freqs. Be warned. Press and hold 2-9-L/O. This will program some test freqs up to ~channel 25. Some are out of band. This will allow

you to get reception for the 54-88Mhz freqs.

That's it.

Any questions?

Dave

PS. I am working on a new antenna...one that utilizes a vibrating 7" real-feel dildo de-virginized by a virgin vixen. I can't reveal the plans just yet...but I can tell you that it *will* act as a filter to receive nothing but the juiciest conversations!! Investors and vixen virgins inquire at above address. You can see all of my inventions and modifications in _Crazy Dave's Scanner Tome_ in a forthcoming "Paladin's Chest and Abs Press" publishing!

The following are Army Reserve frequencies that were used when the 343
Med Unit was assigned to Moffett with their helo's. They have been
deactivated and I doubt you will find them in use now, but try anyway
> ARCOM OPS 34.5
> ARCOM OPS 124.95
> ARCOM OPS 241.2

There is also a trunked federal system with annoying end tones that
effectively stops you from following any conversation. Somebody posted
the other day either on this newsgroup or the Scan-L list. This is what
the ANG guys and Moffett Security guys use along with Moffett Ops.

6099. Maxon GMRS 210+3

Newsgroup: rec.radio.scanner
Date: 1996-09-27 00:00:00 UTC
From: "Andrew R. Gozdziewski" <andrewg@newrock.com>
Message-ID: <324CA71E.4404@newrock.com>
Source record: 221913

I was thinking of buying two Maxon GMRS 210+3s. Does anyone have any comments or expierence with this radio? Good or Bad! Is this a good begining radio like everyone says? Does anyone have another brand that would be better? What is a good price to pay for this model?

Please post or e-mail me your comments!

Thanks

6102. Demodulating ATV/Video from Scanner

Newsgroup: rec.radio.scanner
Date: 1996-09-27 00:00:00 UTC
From: Chris@sublime.com
Message-ID: <Chris-2709962241570001@news.sirius.com>
Source record: 221916
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I would like to be able to receive AM/FM encoded video from a scanner, preferably an AOR 5000.

(No I dont want to buy a R9000 or 7100)

I'm curios how the Icom TV-R7100 TV decoder for the R7000/R7100 works? It looks like it just takes the 10.7 IF from the scanner and puts out Video and stereo audio. Is this correct? Then it should work with any scanner with a 10.7 IF out?

Is there anything else out there similar to the Icom box?

My main interest is to be able to decode ATV broadcasts and microwave truck links.

Thanks
-Chris

6107. Antenna Recommendations for AR8000?

Newsgroup: rec.radio.scanner
Date: 1996-09-27 00:00:00 UTC
From: char0011@maroon.tc.umn.edu
Message-ID: <char0011.843804443@maroon.tc.umn.edu>
Source record: 221945

Well..I decided that I'm gonna take the plunge and get an AR8000 right off the bat. No radio shack stuff..first class first time BAY BEE

Anyway...I've heard that the stock antenna's aren't so hot...can anyone give me hints on a good outdoor and rooftop antenna? I don't want to do something big that requires a tower for outdoors, maybe something along the lines of a small TV antenna (sizewise) Also, I'll be taking the scanner to car races (Road America in Wisconsin..lots of tamping around thru the woods to go to differnet parts of the track..need durability..no telescoping metal antennas there)..So...a good (and durable) rubber duck, and a good but small housetop antenna. If these things exist, please email me at char0011@maroon.tc.umn.edu and point me in the right direction

Thanks in advance
-Bill

WW>From: wood@nexus.aer.loral.com (William Wood)
WW>Subject: San Diego CA MilAir Freqs?

WW>Does anyone have any good information on San Diego area MilAir
WW>frequencies? I have a copy of ScanFan and it lists *tons* of
WW>frequencies, but most of them aren't used on a regular basis.
WW>I'm trying to listen in on their offshore exercises. Also,
WW>if anyone has a good list of SD military callsigns or area
WW>designation signs, I'd like those too. Here are just a few of
WW>the frequency/area names I hear often:

Military air frequencies are generally subject to change without public notice and callsigns/flight-names and other colorful names are variable depending on whatever mission is at hand. They might last a few days or a few months, then never be used again. USN and USAF airbase tower frequencies used to be public knowledge, if memory serves.

WW>I've been considering ordering some Aeronautical charts of the
WW>area to see if it has any useful information. Does anyone ever
WW>use these charts to help in scanning?

I did, but then I had sectionals and locals for flying. If a friend has MS Flight Simulator, you can save the effort of buying charts and just copy those...frequencies are on the charts. Civil airways frequencies seldom change. Note: Three-digit frequencies without fractions are in KHz, not MHz, and pertain to the few low frequency beacon stations that may still exist.

yea I could agree with that up to a point. But remember most of your
150 MHz antennas have an acceptable monitoring range of 20 MHz, & UHF
about double (or more) of that.

> So all rg-59 is the same?
yes, that is the standard for that type of coax. If it has other
qualities it would have a different number.

> So all 9913 type cable is the same?
Yes, again that is the standard.

Dan,

There's another interesting way to demodulate FSK, as long as it's *continuous phase* (no sudden phase jumps between symbols).

See "The Viterbi Algorithm" by G. David Forney, Proceedings of the IEEE, March 1973, p. 268. This is a tutorial on the Viterbi algorithm that had been invented six years earlier as a way to decode convolutional codes, but turns out to have many other uses as well, such as decoding FSK, dealing with intersymbol interference, and recognizing text.

Forney claims that Viterbi decoding of phase-continuous FSK that takes into account the "memory" of the modulator performs 3 dB better than the best you can do with coherent detection over only one symbol interval, and as good as coherent detection of antipodal BPSK.

I believe Dave Mills, W3HCF, has implemented something like this for the TAPR DSP-93 box.

Phil

>email me, or reply here.

>Thanks

>mcarver@nando.net

Police Call, available at Radio Shack, has some listings for Fuquay, but
your police are dispatched out of Raleigh. Here's what I see in PC:

Rescue 155.28
Rural fire 154.19
154.295
Local gov. 156.195
461.0
Police 460.5 (dispatched by Raleigh 911)

I don't believe that Fuquay is part of any trunked 800 system, though they
could have moved to one recently.

David,

I hope that you are being cynical! Do you really think that large
corporations got to where they are by being honest and truthful? Hah!!!
If there is a buck to be made, they will do whatever it takes to sway the
public. I will bet that more than half of all the advertising you see is
hype and BS. One look at an adverage children's toy commercial is enough
to make me sick! They see this dramatic, fancy toy doing all sorts of
crazy things, with the 1812 symphony playing in the background, and when
they open it on Christmas morning they see a lifeless piece of plastic
staring them in the face. That is the reality of corporate America!

> The point is probably moot, though, because I don't think we have any
> ATV repeaters near my home.

There was an article in 73 magazine a while back which detailed how to boost the power of the 900 Mhz. VCR rabbits so they could be used as a 900 Mhz. ATV transmitter. They are already on frequency, and the holder of a technician (or higher class) license would have no problems (FCC reg wise) with using a boosted VCR rabbit for ATV use, as long as it's used within the guidelines of the FCC's amateur service regs.

Any hams in the Boston area who're involved/wants to get involved in 900 Mhz. ATV, please email me. I also
have one of those rabbits and would like to do some 900 Mhz. ATV experimentation some weekend.

I have just bought an Optolinx interface box and its a great feature packed box but now that i have the ability to control my Icom sets i have the problem of getting the receivers to stop during scanning there is an aux socket which requires a audio line squelch line and a ground but unfortunately have no idea how to achieve this.

the radios i am attempting to stop are a ic-706 and 1c-737a any suggestions or ideas would be greatly appreciated i am using scancat gold software and i am aware you can purchase the cable from them but i would like to put one together my self as this won't be the only software used and it would be good if i can use the Optolinx to do the squelch or audio detect.

thanks in advance

There is a forth option here.

You could install the OS535 interface from Optoelectronics. Next
obtain some scanner control software such as Probe, Radio Manager,
Scan*Star, ScanCat Gold and ScannerWEAR. The last step is to obtain
the "key code" to enable cellular coverage. However, an important note
here, the code only works with the control software loaded and running
and the scanner connected to the computer.
Actually I can't see what all the fuss is about cellular for anyway.
I really don't want to listen to who did what to whom down the street

Instead of band specific why not channel specific. You may have a "beam"
(yagi) that recieves better for one specific freq than your overloaded
discone. Let us make the choice at the time of programming. Right?!

6139. Freq Counter - unidirectional?

BC>> receiver where it mixes with the WWV signal.

>(This procedure is called "Zero Beating".)

Not necessarily. That's a colloquial term, generally accepted by all
"in the know", but quite alien to those not so astute. In the lab or
tech shop, "zero beating" is a fine term. It may mean nothing to the
scannist.

WHAT something is "called" is not nearly so important as what it IS.
And I took great pains to lay out in detail what it IS.

Now if you really want to get technical, Mr. Duff, then the process is
called, not "zero beating"....but rather "heterodyning". THAT is the
most correct and most widely understood term, but it suffers from the
same weaknesses as "zero beating" that that many scannists might not
understand it.

So I explained the process.......and I explained it well.

>>You do not want to unnecessarily adjust X-301, but you can test it all
>>you want. Just tune in WWV 10 MHz on your shortwave receiver, and
>>touch a wire to Pin-14 of the MC145158 chip. If the wire is too long,

>For Gosh sakes folks...AC couple the antenna to the chip using a low
>value (.01 uf or so) disc capacitor. All you need is a blown PLL chip !

Oh geezus, Mr. Duff, you still have to touch the chip to do that,
and a capacitor will not stop a static discharge anyway. So that's a
silly extra step that's not at all necessary....especially since that
particular pin in an unused, unloaded output. It does not need a
capacitor at all.........

>The 145158 is a CMOS device...do we need to go thru this again ?

Don't go through it at all. The chip isn't going to blow. There are
several elementary reasons why it won't, but you should know that when
the radio is energized and power is applied to the chip, that it can
be touched with a lot less risk than if the chip is not powered up.

No matter.....but what you don't know is that I developed this procedure and sent it out for wide beta testing SEVERAL YEARS AGO. This recalibration procedure for X-301 in the PRO-2004/5/6 is nothing new, Mr. Duff. It is time-honored and proved. Field proved.

>>If the shortwave receiver has an S-Meter, so much the better
>>because then you will also have visible feedback. Between your eyes
>>and ears, the effects of the two 10 MHz signals will clue you if there
>>is an error between the two. The S-Meter will "jiggle" at the error

>"Jiggle" ? (Beat)

Ummmm, yeah....., but to the uninitiated, "jiggle" is much more definitive and to the point. Succinct. Meaningful.

Again, it is not very important WHAT something is called. In fact, "names" can be very confusing, depending on the audience and who's talking. We could devote an entire topic thread to electronic terms and definitions.......and never get into any hands-on. And bore the hell out of people.

The adjustment of X-301 in the PRO-2004/5/6 is a hands-on process, and one that can be done by most anyone. My article showed how to do it. And it's been done exactly as I described for over four years. People have not blown the chip or encountered any other difficulties. Track record, Mr. Duff. History. Four years of it.

Meanwhile, take a seat and pay atttention. You might learn something. One of the many things I do very well (thank you) is communicate high technology to the lay person.....to the dude who barely knows a resistor from a resister. I communicate in the vernacular so that the ordinary dude can roll up his sleeves and get right to work without stumbling over terms, acronyms, and vague or unfamiliar expressions.

The alternative is to post a glossary along with each article, but that would be silly and a waste of time. I dispense with the glossary that wouldn't be read anyway and cut to the chase with meat 'n taters.

Something you'd do well to master.............

At face value, that's great. Well, it's great, no matter what. But
in this case, learning about the basics of 75-ohm and 50-ohm cables is
a lot like learning about blue skies, green grass, and hard rocks.
Elementary, my dear Watson.......and it does raise questions about the
preparedness of the current crop of Amateur Radio Operators.

> Does anyone here realize that we have been
>debating about different types of cable and their pros and cons?

Oh yes, indeed. I realize that a lot of time has been consumed with
the elementals when most people are quite capable and desirous of
learning the more esoteric and sophisticated stuff. You could have
learned more and to the point by asking straight questions.

> Ok, Ok, it's in the form of a flame, but it is very
> useful information none the less.

Hmmmmmm. Amazing. It used to be on the novice ham radio tests.

> I realize I started this fight when I picked on Bills' answer,
> but it has shown me the differences between many different types of cable.

So why did you have to start a big ol' snit? Why not just ask?

> I think I feel a group hug coming on. NOT!!!!

You're right. (Not.)

>What's your next title wild Bill?

What would you LIKE for it to be? Do you think we're done with
cables? (Not.) Your cousin just unloaded a bunch of silly stuff
about the effects of ultraviolet on cables. Do you think he's right?

I have two shortwave radios that I would like to trade for a hand held scanner. The radios are:

Sangean ATS 818 - Full coverage receiever, LW, MW, SW, and FM. Two clocks, timer, sleep timer, 45 memories, SSB coverage. Radio comes with manual and AC adaptor.

Sony SW 40 - LW, MW, SW, and FM. Clock, timer, sleep timer, 20 memories, carrying case, and manual.

If interested please email: dschopp@ix.netcom.com

Thanks,

Dan Schopp

6156. Wanted: Nicad Charging Tips

Newsgroup: rec.radio.scanner

From: legeros@nina.pagesz.net
Message-ID: <52j6tf$vcu@nina.pagesz.net>
Source record: 221798

Can anyone give me (or point me to) some tips for charging the nicad batteries on my Sportcat? Should I drain it completely, ever time I charge it? Should I do that periodically?? How often should I charge??? The scanner uses a factory-built battery, so, obviously, I want to extend its life as long as possible.

Please e-mail. Thanks.

Which ng? You have posted to:

rec.travel.air,alt.radio.scanner,rec.radio.scanner,
rec.radio.shortwave,rec.radio.amateur.misc,rec.aviation.piloting

> that listed airlines that tested certian toys on their planes
>and found that they did not bother anything electronic on the plane
>and therefore allow you to use the toys.

I haven't seen any such list, and *every* airline with which I fly my
300,000+ per year *specifically* excludes such toys.

> it also listed airlines that
>tested toys and found them to be unsatisfactory for use on the plane.
>not all scanners and computers will harm the electronics on a plane.
>it all depends on the electronics that the plane is outfitted with.

I can't argue with that. But again, I make the point that if it's
against the airline's rules, you shouldn't be using them.

6162. Re: Airplane interference..

Newsgroup: rec.radio.scanner
Date: 1996-09-28 00:00:00 UTC
From: "Max A. Schneider" <mschneid@tir.com>
Message-ID: <01bbad41$3805bc00$834ddacd@mschneid.tir.com>
Source record: 221804

The scanner generates a certain amount of RF, which can affect communication and navigation equipment performance on aircraft. As a result, most airlines prohibit the use of all types of radio equipment on board. This is generally true of other electronic equipment, such as cell phones and personal computers. That's why you'll hear the announcement to put your PC away as the plane begins its descent.

Hello.

My friend have a PRO2032. A morning he turns it on to listen in and
nothing... The scanner works ok, it's A1 except it receives nothing.
NOTHING. In all bands. Even with the squelch at 0 on 162.5500 all it
can hears is CHEETTTTT.

All was verified and tried, antennas, connectors, reset button, etc.
The scanner is deaf. It scans and receives nothing. Did you ever
saw such a problem? Help please...

M.C.

Posted from UK Company for buyers in the USA

"All enquiries for more information will
be kept in strictest confidence possible"

"Remember your details are secure in the UK"

"This mail has been posted for informational purposes only"

To those of you in the USA that may be interested in programming EDACS MPA and MPD Radios (and others) for the GE / Ericsson 800Mhz Trunk System.

We are based in the UK and have just found a source for an electronic module with free programming information for the above. The commercial version of programming software normally sells for around $7000, but is not avalible to the public.

For the hobbyist and for educational purposes only. We can offer the electronic module and free programming information for only $1000. Our module and information will do the same job as the commercial product.

For more detailed information, please send Private Email to smd@fonix.org. Please give us details of your real name and contact tel. number in your reply as we want to ensure you are a hobbyist. Again all enquiries will be treated in the strictest confidence. "You are doing nothing wrong by requesting information".

Please Note: We will not send further details, unless you send us yours, this is to protect every-bodies privacy. Please allow time for us to reply as there may be a high demand for information, thankyou.

Regards, Mike Jones
Super Micro Devices (SMD). London. UK.

I am planning on getting my first scanner and I saw this PRO-2040 on sale ($199 Canadian) at Radio Shack. Is this model any good????

Does anyone currently own this PRO-2040? I would appreciate your opinion, thanks!

Also, are the Bearcats a lot better than these Radio Shack models in terms of performance and reliability?

Really? Then your state wouldn't mind losing the BILLIONS (yes,
BILLIONS) of dollars a year that Canadian snowbirds pump into the economy
of Florida? You, and the other people of Florida, might just find it a
little harder to keep that job to drive to!

>Iwas just wondering why?

So the pilot can set the altimiter on the airplane to 2990 and get accurate altitude readings. An altimiter works by sensing air pressure, since air pressure decreases as you go higher. However air pressure also varies on its own, and from region to region. That is why each altimieter has a little dial to compensate for the current air pressure.

I have a Digi-Max D-1200 counter good up to 1200 mhz for sale or trade.

Will take $85 and ship to cont. U.S. or trade to scanner related hardware, interfaces, software (licensed), antennas, etc.

I need an Antenna Specialist mag mount scanner antenna with the "grabber" coil, discone or scantenna base antenna.

Counter comes with antenna, power supply and manual. Will work from 12vdc for mobile use. Has sensitivity control for strong signals.

Evidently I'm not "uninitiated," then, because to me the word "jiggle"
conveys something quite different than what you get when zero beating
with WWV. "Waver" "fluctuate," or "oscillate" might be better
choices. Scannists DO understand "oscillate," don't they? No, it
doesn't mean kissing.

>Something you'd do well to master.............

I purchased a Pro 2040 this week, it was on sale for $179 American at my local RS. The 2040 is made for Radio Shack by Uniden and was reviewed in the December 1995 issue of "The Monitoring Times." For the price I'm happy with it. It has decent sensitivity, I define sensitivity by the number of transmissions I can hear from police cars, not the dispatcher. The 2040 has surprised me with the number of replies I can hear from police cars. It's a double conversion receiver so don't plan on connecting it to an external antenna and there is some intermodulation, especially at night but I can live with that. All in all I don't think it's a bad scanner for the price, as long as you can live with a few shortcomings. Would I recommend it, yes. And if you don't like it you have 30 days to return it.

Howdy,

Does any happen to have the codes for the PD and FD in both Santa Clara County and San Mateo County's in Norther CA?

I mostly need local law, FD, Sheriff and CHP codes

If any of y'all happen to know the "live" frequencies in this area as well I would also appreciate them as well.

Thank you

There have been several posts here about the funniest
things we've heard on our scanners. There's a new TV
program out that focuses on nothing but that. It's
called America's Dumbest Criminals. They have a web
site at http://www.dumbcrimes.com

It's worth checking out if you've enjoyed the posts
in here :)

Looking to sell Radio Shack Pro-39 scanner, less than a year old, BARELY even used, looks brand new.. Covers various frquencies VHF-Lo, Ham,Aircraft, Government, Ham (144Mhz-148) VHF-Hi, Ham/Govt, UHF-Lo, UHF-TV, UHF Hi 800 Mhz bands and 900 bands.. Hyperscan, 200 channels memory, (10 banks of 20 channels each), good scanner model, near top of the line.. Has instruction booklet, AC adapter, Retractable enchanced antenna.. Bought for $300, looking to get $175-$200 + shipping.

Please leave your replies/offers to my email address:
sac47700@saclink.csus.edu

Thank you,
Brian McDonald

> please respond by e-mail to cjs7@juno.com
> THANKS ALOT IN ADVANCE

Conventional barometric altimeters use the outside air pressure to give
altitude. The air pressure affects a samll diaphram inside of the altimeter
which is geared to the dials on the face of the altimeter that the pilot reads.

When an airplane is sitting on the runway at an airport at 1000 feet the altimter
should read 1000 feet. Now if a low pressure system should travel when this airplane
sits, the diaphram will expand and the altimter will read a higher than 1000 feet
altitude. By adusting the altimter to the current barometric pressure measured in
inches of mercury via a small knob on the altimter, the altimeter can be corrected and
should read 1000 feet if set to the proper setting.

Standard air pressure at sea level is 29.92 inches of mercury. This is what the airlines
set their altimeters to when flying above 18000 feet (Flight level 180) By doing this,
there is no need to adjust the altimeter every 100 miles. So actually the airlines or
anyone above flight level 180 flys what is known as "pressure altitudues"

6217. Re: Any Mods for Pro 2030?

Newsgroup: rec.radio.scanner
Date: 1996-09-28 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <9609280925345809@atdbbs.com>
Source record: 221859

Modification to restore cellular frequencies in the Radio Shack PRO-2030 Scanner.

This mod is essentially the same as the PRO2026 except the location of the jumper is slightly different.

1. Remove power cable.
2. Turn unit upside down.
3. Remove five (5) recessed screws from bottom panel.
4. Carefully remove bottom panel.
5. With display panel facing you, locate the jumper marked L201 on the circuit board attached to the display. It will be about 2" in from the from and 2" in from the right side. It will look like a RF coil.
6. Cut the jumper marked L201.
7. Reinstall the bottom and reconnect power. Scanner is ready for use.
8. Cellular frequencies are now restored with 30 Khz channel spacing.

Please note: I picked up this mod from the FIDO net. I have never completed the mod myself because I own the 2006. But I do have the service manual and this is the diode that locks out the cellular band. Even the specs show this diode connected to pin 10 of the microprocessor. This pin is the STRAP OPTION CELLULAR SKIP. Too easy!

6220. Easley, SC: Help with strange Codes and Signals

Newsgroup: rec.radio.scanner
Date: 1996-09-29 00:00:00 UTC
From: boscoe@worldnet.att.net
Message-ID: <52mrjf$khg@mtinsc01-mgt.ops.worldnet.att.net>
Source record: 221668

I would appreciate any help with the codes and signals that the Easley, SC PD uses. They must be different from what the Police Call describes because I heard one a couple of weeks ago that would have translated into "dead animal in the middle of the road in Room 110 at Days' Inn - Situation normal"

Now I've slept at the Days' Inn in Easley and can testify that, although it's not the Ritz, the message as described would not be "normal".

I don't think that they use any other standard 10-code system. If you can help with any Easley, Greenville, or Pickens County codes it would be greatly appreciated. Thanks.

Is this really the forum for this? It belongs in the CB radio forum. The FCC has admitted countless times that they do NOT have enough manpower to enforce their own laws regarding CB radios & such. There are too many people running with a "kicker" either attached to their radios, or installed in them. This is proof of what happens when they did away with the requirement of needing a license to operate a
CB radio. Worst thing they ever did.

Dan Henderson (dandan2@erols.com) spilled onto his news spool:
: According to the safety announcements...ANY receiver cannot EVER be
: used...not after 10 minutes after t/off and 10 min prior to landing like
: computers and other things are...NO receiver cannot be used....The point
: is mute re scanners...THEY CANNOT BE USED...and all the airlines have the
: same rule, at least in the USA...

Did you read the material you were responding to? ASA specifically
permitted them, and Delta specifically mentioned they had to be off only
during the low altitude, taxi, etc., phases which rather implies they
are allowed otherwise. If there is one thing that characterizes US
carriers' policies in this area, it is a *lack* of consistency other
than requiring that PEDs be turned off below 10,000 feet.

When I received my free catalog (I had a coupon from their flier,
I asked the store clerk, what the scoop was on the catalogues. The stores
that give it out free are taking a loss (its coming out of their pockets),
so I guess the hi-volume storess or good customers can get it free, but
according to the company, they do ring it up as a part number in the
register, it is supposed to cost $3.00. Regular customers with the flier
get it for nothing, and the sales clerk did not take my coupon away, so I
can go to another store and get a second one for free!

Bill you are an idiot.

The effects of UV on cables is not "a bunch of silly stuff". It is a
well
know established fact. I am surprised that a "engineer" does not know
this.

I think that is the problem. If there were more people out there
WITH practical experience they wouldn't even CONSIDER argueing
for anything but 50 ohm.

> probably won't affect receive that you could tell the difference.

There is some truth to that. **BUT**, that is assuming you have a
antenna
that is perfectly matched to 50 ohms at the frequency you are on & that
the antenna input is 50 ohms on the receiver. Some scanners vary.
PLUS,
using a scanner you are often receiving a wide range of frequencies,
possibly
on several different bands. One thing that many manufacturers don't
tell
you is that on these multi-band receiving antennas the "Q" or bandwidth
is
very narrow. In other words, their range of resonance is smaller than
normal. Once you hit the edge of the Q or bandwidth, that 1.5:1 swr
(which was probably acceptable for the 50-75 OHM coax) is now doubled or
tripled up to 3:1 or 4:1. Thus having a negative affect on your
overall antenna performance.

> However, 2 things:
>
> (1) Why not use RG8X cable? It's 50 Ohms so it matches well (although
> we have already determined that is not a big deal) and it is

Better yet, why not use RG-213. It is only slightly more expensive
than RG-8 & is UV resistant so it will last years & years. The life
of RG-8, due to the UV problem, is only 2-3 years.

> (2) I see some bashing of the Amateur Radio community from time to

Bill Cheek likes to bash ANYONE who does not view things as he sees fit.
Many licensed amateurs do not agree with various technical advice that
Bill gives. (like using a matalic screwdriver to adjust a capacitor in
an RF circuit). So as a result he bashes ham quite often. Strange,

he claims to teach ham radio classes (but does not have a ham license).
He also claims to be a Chemical Engineer, Elect. Engineer, & Logistical
Engineer. He claims to have both an MBA & MSEE.

> Not that I care what everyone thinks about the FCC amateur program,
> but I just got my license this year and it was not so that I would
> know everything there is to know about the radio art. We all realize

Congrats on the new license. I just got my Extra about 2 years ago,
I've
had a him ticket for 13 years.

Can anyone advise me on the choice of an outside antenna. I have narrowed it down to a D130j discone or an Scantenna from Antennacraft. I live in northwest suburban Chicago, have a pro 2004 and enjoy scaning air, public safety and ham frequencies. I'm mainly concerned about inter-mod from adjacent channels. Thanks in advance for your help.

Dennis

>
Peter,
Be prepared to see Eurocontrol switch to 8.33 kHz increments in the
next couple of years. Due to crowding on the CAA band, industry has
been notified of a proposal that is close to being ratified by the EU
to go to narrowband AM (5 kHz BW) by 1999. The US FAA is researching a
12.5 kHz requirement that supports data and voice in the 118.000 to
136.000 MHz band. More news to follow....

6251. Bearcat 210 question (add on board)

Newsgroup: rec.radio.scanner
Date: 1996-09-29 00:00:00 UTC
From: Matthew Kleinmann <matthew@chiapet.geo.cornell.edu>
Message-ID: <324EEDB7.2801@chiapet.geo.cornell.edu>
Source record: 221699

I just picked up an old Bearcat 210 18 channel scanner at a yard sale the other day. After I got it home and began playing with it, I noaticed a BNC jack someone had added to the back. I had assumed that it was jumpered over to the antenna input. Anyway, curiosity got the better of me, and I popped the beast open, and son of a gun if someone did not bolt a cute lil board in the rear left corner of the thing. I figure it is not stock because it is in the way of the dorkey little antenna that normally screws into the top of the thing. The board has three pieces of thin coax going to it, two from the scanner board, and one from the BNC jack, and it has two other wires that look like power going to it. The board has two IC's on it, a motorola MC1357P and a TL071. I recognise the TL071 as an opamp, and the coac going to the BNC comes off near that, so I figure that may be some kind of an ?audio? out. I am still trying to figure out what the 1357P is. Do any of you have a clue as to what the board is or does? Also, the scanner has a search button on it, but I have yet to be able to get it to do anything. Anybody know how that works or what she does? Many thanks in advance!

--Matthew

6252. WTB scanners [10 to 20 channel] USED

Hi

I am looking for any 10 to 20 channel scanners. Base/mobile/handheld. 30 to 512 MHZ
They must be in perfect working condition and look good. I prefer them to have manuals but its ok if they dont. Of course I am looking for a low price. No crystal scanners.
If the price is right I will prepay with postal money order or if you prefer you can send it COD. I would like about 4 of them.

Whatchagot???

Hi!

I am selling my RS PRO-51 handheld scanner for $225. This price
includes:

PRO-51 scanner
Case Logic case
Plug-in power adapter
Shipping/Handling charges

This scanner is like-new. It has been in the box it came in for most of
the time I have had it, so it still has a clean appearance and
everything works properly with it. I have only used it *maybe* 10 times
in the last 2/3 years. So it really is like new.

I am asking $225, but I will take other offers since I am really wanting
to get rid of this. I am selling it because I have shifted my hobbies to
computing and music and I want to use the money to support those new
hobbies.

Thanks!

CU>listening to the life flight helicopters, I hear the phrase "cold
CU>unload" am I hearing this right? Is this dead body?

No. A "cold" unload or load is one that is done with the helicopter
engine shut down. A "hot" load or unload is one down with the engine and
rotors turning. Usually a hot load is done at a scene where the patient
is packaged and ready to go when the helicopter arrives.

WAH WAH WAAH!!!!

What does FIDO have to do with the internet? The truth is, you won't send him e-mail because you don't want him to respond. I have your e-mail address Mr. Mackey, but I won't pass it around. When you are good and ready to face your opponent like a real person, then you might give it out. However, until then, I will keep mum and see how long you carry on this follishness.

Police Radio Codes

The following is a combined list of those radio codes used by the majority of the police departments in the San Francisco Bay area. Each agency also has codes that are unique to that agency's particular task.

In addition to these codes, there are the California Penal Code sections used by police officers and dispatch. For example, a "415 - Family" refers to a family disturbance. Section 415 of the California Penal
Code is entitled "Fighting, noise, offensive words" and is commonly termed
as `disturbing the peace.' A list of the most often used California Penal
Code sections is found at the end of this document.

10-00 Codes

10-0 Exercise great caution.
10-1 Reception is poor.
10-2 Reception is good.
10-3 Stop transmitting.
10-4 Message received.
10-5 Relay message.
10-6 Change channel.
10-7 Out of service/unavailable for assignment.
10-7A Out of service at home.
10-7B Out of service - personal.
10-8 In service/available for assignment.
10-9 Repeat last transmission.
10-10 Off duty.
10-10A Off duty at home.
10-11 Identify this frequency.
10-12 Visitors are present (be discrete).

10-13 Advise weather and road conditions.
10-14 Citizen holding suspect.
10-15 Prisoner in custody.
10-16 Pick up prisoner.
10-17 Request for gasoline.
10-18 Equipment exchange.
10-19 Return/returning to the station.
10-20 Location?
10-21 Telephone:_____
10-21A Advise home that I will return at _____.
10-22 Disregard the last assignment.
10-22C Leave area if all secure; no responsible person/owner is
enroute.
10-23 Standby.
10-24 Request car-to-car transmission.
10-25 Do you have contact with _____?
10-26 Clear.
10-27 Driver's license check.
10-28 Vehicle registration request.
10-29 Check for being wanted/warrants.
10-29F The subject is wanted for a felony.
10-29H Caution - severe hazard potential.
10-29M The subject is wanted for a misdemeanor.
10-29V The vehicle is wanted in connection with a possible crime.
10-30 Does not conform to regulations.
10-32 Drowning.
10-33 Alarm sounding.
10-34 Assist at office.
10-35 Time check.
10-36 Confidential information.
10-37 Identify the operator.
10-39 Can _____ come to the radio?
10-40 Is _____ available for a telephone call?
10-42 Check on the welfare of/at _____.
10-43 Call a doctor.
10-45 What is the condition of the patient?
10-45A Condition of patient is good.
10-45B Condition of patient is serious.
10-45C Condition of patient is critical.
10-45D Patient is deceased.
10-49 Proceed to _____.
10-50 Subject is under the influence of narcotics.
10-51 Subject is drunk.
10-52 Resuscitator is needed.
10-53 Man down.
10-54 Possible dead body.
10-55 This is a coroner's case.
10-56 Suicide.
10-56A Suicide attempt.
10-57 Missing person.

10-59 Security check.
10-60 Lock out.
10-61 Miscellaneous public service.
10-62 Meet a citizen.
10-62A Take a report from a citizen.
10-62B Civil standby.
10-63 Prepare to copy.
10-64 Found property.
10-66 Suspicious person.
10-67 Person calling for help.
10-68 Call for police made via telephone.
10-70 Prowler.
10-71 Shooting.
10-72 Gun involved.
10-73 How do you receive?
10-79 Bomb threat.
10-80 Explosion.
10-86 Any traffic?
10-88 Assume your post.
10-91 Animal.
10-91A Stray.
10-91B Noisy animal.
10-91C Injured animal.
10-91D Dead animal.
10-91E Animal bite.
10-91G Animal pickup.
10-91J Pickup/collect _____.
10-91L Leash law violation.
10-91V Vicious animal.
10-95 Requesting an I.D./Tech unit.
10-97 Arrived at the scene.
10-98 Available for assignment.
10-100 Civil disturbance - Mutual aid standby.
10-101 Civil disturbance - Mutual aid request.

11-00 Codes

11-10 Take a report.
11-24 Abandoned automobile.
11-25 Traffic hazard.
11-26 Abandoned bicycle.
11-27 10-27 with the driver being held.
11-28 10-28 with the driver being held.
11-40 Advise if an ambulance is needed.
11-41 An ambulance is needed.
11-42 No ambulance is needed.
11-48 Furnish transportation.
11-51 Escort.
11-52 Funeral detail.
11-54 Suspicious vehicle.
11-55 Officer is being followed by automobile.

11-56 Officer is being followed by auto containing dangerous
persons.
11-57 An unidentified auto appeared at the scene of the assignment.
11-58 Radio traffic is being monitored. Phone all non-routine
messages.
11-59 Give intensive attention to high hazard/business areas.
11-60 Attack in a high hazard area.
11-65 Signal light is out.
11-66 Defective traffic light.
11-78 Aircraft accident.
11-79 Accident - ambulance has been sent.
11-80 Accident - major injuries.
11-81 Accident - minor injuries.
11-82 Accident - no injuries.
11-83 Accident - no details.
11-84 Direct traffic.
11-85 Tow truck required.
11-94 Pedestrian stop.
11-95 Routine traffic stop.
11-96 Checking a suspicious vehicle.
11-97 Time/security check on patrol vehicles.
11-98 Meet: _______
11-99 Officer needs help.

900 Series Codes

904 Fire.
904A Automobile fire.
904B Building fire.
904G Grass fire.
909 Traffic problem; police needed.
910 Can handle this detail.
932 Turn on _______ mobile relay at _______.
933 Turn off mobile relay.
949 Burning inspection at _______.
950 Control burn in progress/about to begin/ended.
951 Need fire investigator.
952 Report on conditions.
953 Investigate smoke.
953A Investigate gas.
954 Off the air at the scene of the fire.
955 Fire is under control.
956 Assignment not finished.
980 Restrict calls to emergency only.
981 Resume normal traffic.

Other Codes

Code 1 Do so at your convenience.
Code 2 Urgent.
Code 3 Emergency/lights and siren.

Code 4 No further assistance is needed.
Code 5 Stakeout.
Code 6 Responding from a long distance.
Code 7 Mealtime.
Code 8 Request cover/backup.
Code 9 Set up a roadblock.
Code 33 Mobile emergency - clear this radio channel.

Scanning Aboard Airliners

The question of the use of scanning receivers aboard commercial
airlines arises from time to time. The following is an extract from
the FAA Regulations (FARs) and the stated positions of a number of
major carriers.
It should be noted that in FAR 91.21, the term "operator" refers
to the airline, not the pilot. The captain on your flight may impose
additional restrictions depending on conditions, but he may not waive
limits established by the airline.
The quotations from various airline policies were correct as of
the date noted, but are subject to change. If any question arises, ask
the cabin attendant to check with the flight crew, then obey their
instructions. I may be on the same flight, and I would prefer that
stray R.F. not vector us into the side of a mountain.

Federal Aviation Administration Regulations
14 CFR 91.21 - Portable Electronic Devices

(a) Except as provided in paragraph (b) of this section, no person may operate, nor may any operator or pilot in command of an aircraft allow the operation of, any portable electronic device on any of the following U.S.-registered civil aircraft:
(1) Aircraft operated by a holder of an air carrier operating certificate or an operating certificate; or
(2) Any other aircraft while it is operated under IFR.

(b) Paragraph (a) of this section does not apply to -
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers; or
(5) Any other portable electronic device that the operator of the aircraft has determined will not cause interference with the navigation or communication system of the aircraft on which it is to be used.

(c) In the case of an aircraft operated by a holder of an air carrier operating certificate or an operating certificate, the determination required by paragraph (b)(5) of this section shall be made by that operator of the aircraft on which the particular device is to be used. In the case of other aircraft, the determination may be made by the pilot in command or other operator of the aircraft.

Delta Air Lines
from the "On Board" section of SKY magazine, January 1995

PORTABLE ELECTRONIC DEVICES - Current regulations prohibit the use of certain types of portable electronic devices (PEDs) on board commercial aircraft, due to the potential for interference with navigation and communications equipment.
The following devices may not be operated at any time on Delta aircraft: cellular telephones, commercial two-way transmitters (i.e. walkie-talkies); amateur transmitters (i.e. ham radios); citizen band (CB) transmitters; 49 MHz transmitters; devices designed to radiate RF energy on a specific frequency; peripheral devices for computers or games connected by cable (i.e. printers); AM/FM radios and portable TV sets; remote-control toys.
The following may not be operated when the aircraft is at the gate, in the taxi, take-off, initial climb, approach, and landing phases: personal computers (cable-connected peripheral devices such as printers, external disc drives, etc, are not authorized); personal computer games; VHF scanner receivers; compact-disc players; digital/ cassette-tape player-recorders; video recorders/playback systems; calculators.
The following may be operated at all times: hearing aids; heart pacemakers and other implanted medical devices; electronic watches;

electronic nerve stimulators; properly certified operator-installed and -maintained equipment, such as the public passenger-telephone equipment. Personal life-support systems may be operated during all phases of flight, provided that the equipment conforms to the criteria established by the administrator of the Federal Aviation Administration (FAA).

United Airlines
press release

UNITED AIRLINES PROHIBITS USE OF
PORTABLE ELECTRONIC DEVICES DURING TAKEOFFS AND LANDINGS

Chicago, June 22, 1993 -- United Airlines today announced that effective July 1, it will prohibit the use of portable electronic devices, such as laptop computers and compact disc players, onboard its aircraft during takeoffs and landings.

United said its policy was developed to address the possibility of such devices causing electromagnetic interference with cockpit navigation or communications systems when aircraft are on the ground or flying below 10,000 feet -- the most critical phase of aircraft operation.

"We have not experienced any safety problems with these devices, but enough questions have been raised in the industry to prompt us to implement this policy as a precautionary measure until further study determines if any safety hazard exists," said Ed Soliday, United's director-corporate safety and security.

Excluded from the new policy are electronic medical devices -- such as hearing aids and pacemakers -- and electronic watches, which may be used onboard an aircraft at any time.

United said when an aircraft is flying at or above 10,000 feet -- which normally occurs within 10 minutes of takeoff and until 10 minutes before landing -- passengers may use the following devices:

o compact disc players;
o electronic cameras (film or video);
o electric shavers;
o hand-held electronic calculators;
o hand-held electronic games;
o portable audio tape players;
o portable video players (tape playback only);
o portable voice recorders (dictation equipment);
o portable computers with accessory printers and tape or disk drives.

-UA-

American Airlines
from the "Vantage Point" column of American Way magazine, July 1993

[....]

Products known to cause problems include cellular phones, portable radios and televisions, and remote-control toys, which federal regulators have long barred on commercial aircraft. (The Airfones available on most of our airplanes are specially engineered to eliminate interference with aircraft systems, and they have been thoroughly tested to ensure that result.)
The jury is out on whether other devices - small computers, compact-disc players, hand-held video games among them - have similar effects. Although scientific studies have been inconclusive, there is mounting anecdotal evidence of sporatic and poorly understood problems. When safety is at stake, taking avoidable risk is simply unacceptable. That is why some air carriers outlaw the use of electronic devices during all or part of their flights. American Airlines announced recently that it will no longer permit the use of such devices during takeoff and landing, and while flying at altitudes lower than 10,000 feet, the phases of flight during which cockpit instruments are used most intensively.

[....]

Atlantic Southeast Airlines
from the ASA Flight Attendant Manual, pp 3-49&50, November 2, 1993

3.13. Portable electronic devices

A. Regulations

The FAA prohibits use of electronic devices such as AM/FM radios, cellular telephones, etc. during flight. These receivers have circuits which can radiate signals strong enough to interfere with the aircraft's navigational systems. Non-transmitting portable electronic devices shall not be used during takeoff and landing when the seat belt sign is on, or when directed by a crew member, or during operations below 10,000 feet. However, non-transmitting portable electronic devices may be used at other times. If interference from the portable electronic device is suspected, the captain may prohibit operation of the device.

1. Prohibited equipment
The following may not be operated at any time on ASA aircraft:
a. Cellular telephones.
b. Commercial two-way radios (i.e. Walkie Talkie).
c. Personal two-way radios (i.e. Ham operators).
d. Citizen Band (CB) radio.
e. 49 MHz Transmitters.
f. Peripheral devices for computers or computer games
(i.e. printers, external mouse, "joy sticks").
g. AM/FM radios and televisions.
h. Remote controlled toys.
i. Devices designed to radiate radio frequencies (RF) energy on

specific frequencies.
j. Cassette tape players with AM/FM radio capability.
k. Cpmpact Disc players.

2. Acceptable equipment
The following may be operated when there is not a sterile cockpit in effect. The devices must be turned off when the seat belt sign is turned on for approach.
a. Personal computers (see restriction f above).
b. Personal computer games (see restriction f above).
c. VHF scanner receivers.
d. Digital cassette tape player-recorders.
e. Video recorders/internal playback systems.
f. Calculators.

3. The following devices may be operated at all times.
a. Hearing aids.
b. Heart pacemakers or other implanted medical devices.
c. Electronic watches.
d. Electronic nerve stimulators.
e. Electric shavers.
f. ASA installed equipment.
g. Pagers.
h. Acceptable personal life support systems.

Southwest Airlines
(from correspondence dated 12 April 95)

Ground Operations Customer Service Manual -

The FAA allows inflight use of headsets, portable computers, calculators, and electronics games, provided they can be stowed properly in accordance with this rule. Customers should be requested not to use these devices during takeoffs and landings. The FAA does not allow inflight use of walkie-talkies, radio controlled toys, AM/FM radios, portable telephones, or portable television sets, all of which may affect aircraft radio and navigation equipment.

Safety Cards -

Portable Electronic Devices Not Acceptable
Telephones

F.Y.I...

You can certainly program the radio with the frequencies you wish to monitor, but in order for it to "follow" the handoffs or actually perform like the radio you wish to monitor you must program it with the corresponding Site I.D.'s & Talkgroups, which is not cloneable from other radios nor can you enter that data without a generated "codeplug" file that is only available from the TCMS administrator or you gotta have a System Key, highly unlikely unless you work for that specific SMR.
Plus if it's a MTX 800 it won't scan, but the MTX 8000 will.

Came into possesion of some older xtal scanners for $5 each!
Just had to rub it in to youse guys.
Actually the guy has a few more for sale ifyou're in the LA CA area. i
got the Pro 14,Pro7a and Pro 45.
They only pickup 30-50, 144-174 and 450 mHz bands tho and i'll have to
order some xtals from RS.

Law codes are the same all through out the state. Check my web page for
a link to the "California Law Code" page. It's a data base where you
can type in the code or a key word and find the law text. Example, 415
is disturbing the peace, 211 armed robbery, etc ...

I also have a listing of 10 codes but they vary from agency to agency.
The 10 codes will be listed under the Simi Valley PD section. There
is also a listing of abreviations (DUI, GOA, etc ...)

I have a listing of CHP freqs also, but I don't think I have all of the
northern cal CHP freqs :(

> I see info on mods for the 2005 and 2006 but never anything on the 2004.

The PRO-2004, 2005, and 2006 are all essentially the same scanner.
Within a wide boundary, anything that can be done to one can be done
to the other two. The PRO-2004 differs mechanically and aesthetically
from the 2005/6 so specific hardware add-ons for the 2005/6 might not
be possible for the 2004. That depends.....

>Also, any opinions on the scanner control software?

Unfortunately, I don't think the Optoelectronics interfaces will work
in the PRO-2004, and if true, then the only choice is the CE-232
Scanner/Computer Interface.....a full two-way control and data
acquisition "smart" RS-232 controller that works on a variety of
scanners including the PRO-2004. (Software included.)

Below is a Press Release on the CE-232 that was posted a couple of
months ago.

Rgds,

Bill

==========

July 19, 1996 PRESS RELEASE July 19, 1996

The CE-232 SCANNER/COMPUTER INTERFACE
from COMMtronics Engineering
PO Box 262478
San Diego, CA 92196
Fax/BBS: (619) 578-9247
E-mail: bcheek@cts.com

Effective 7/9/96, the standard everyday price of the basic CE-232 Kit
has been permanently reduced from $194.95 to $149.95.

The price of the Assembled/Tested CE-232 board has been reduced from
$244.95 to $199.95.

Contact me privately for other substantial price reductions.

OVERVIEW
========

The CE-232 Scanner/Computer Interface is a 2.5" x 3" electronic board that goes between an IBM-PC/XT/AT/compatible computer and a scanner, for some very powerful capabilities.

The CE-232 is a -smart- RS-232 Interface controller and data acquisition system for some scanners and at least a drudgery-free automatic programmer and remote controller for all supported scanners.

The CE-232 eliminates the drudgery and disappointment in scanning by its ability to "AutoProgram" up to 999 memory channels from a plain ASCII text file in a short time, error-free and exactly the way you want it.

The CE-232 also allows control of the scanner from the computer's keyboard; a strong plus for handheld scanners and those with hard-to-operate keyboards!

The CE-232 is a one-way controller and AutoProgrammer like described above for MANY scanners, including the PRO-2042, PRO-2035, PRO-2022, PRO-43, PRO-39, PRO-37, PRO-34, PRO-26, etc.

The CE-232 is a TWO-WAY controller and data acquisition system for the time-honored PRO-2004, PRO-2005, and PRO-2006 scanners which have unique circuitry that allows the CE-232 to do a LOT more than just AutoProgram and Remote Control, including log data on "hits", reject undesirable signals, look up data about a certain frequency, and much more described below.

Inquire for details about these or the many other scanners with which the CE-232 Interface is powerfully capable.

==
DESCRIPTION OF CE-232 PERFORMANCE & SPECS
==

** Operate the scanner from the Computer's Keyboard! **

REMOTE CONTROL FROM COMPUTER'S KEYBOARD:

Virtually all functions of the scanner can be operated from the computer's keyboard. For example, a replica of the scanner's front panel is displayed on the monitor along with a keypad emulator to show the keys to be pressed as if you were operating the scanner in a normal manner. The CE-232 does not slow down the scanner nor alter its peformance in any manner! Not only can you operate the scanner from the computer's keyboard, you can also operate normally from the scanner as well.

NOTE FOR PRO-2004/5/6 ONLY: As the scanner operates, the computer monitor displays EVERYTHING that the scanner shows in its LCD display!

==

** The scanner is AutoProgrammable by the CE-232! **

AUTOPROGRAMMER

The CE-232 can auto-download into the scanner's memory up to 999 channels at a time, from a previously prepared plain text list of frequencies! Auto-Programming includes channel, frequency, DELAY, MODE, and LOCKOUT functions as desired.

This AutoProgram feature applies to all supported scanners, limited only by the number of memory channels in the scanner, up to a maximum of 999.

You can also manually program the scanner from the computer's keyboard,
in conjunction with normal remote keyboard control as described above.

NOTE: The AutoProgrammer function of the CE-232 uses a very simple ASCII text format, well within the capability of any text editor and/or database manager to construct and lay out.

** The CE-232 has good 3rd party support **

Now get this: the PerCon Corp (regional+) FCC-Databases-On-CDROM have a special export feature for the exact type of file format (*.APF) for quick and automatic generation of AutoProgrammer files for the CE-232 Interface! Within minutes, you can have thousands of frequencies for your area ready to be AutoProgrammed into your scanner! For more information about PerCon Corp and their FCC Database products write or fax:

PerCon Corp; 4906 Maple Springs/Ellery Road; Bemus Point, NY 14712
Fax: (716) 386-6013 Voice: (716) 386-6015
E-mail: admin@perconcorp.com http://www.perconcorp.com

==========

** CE-232 has 4 Electronic Switches for User Control of modifications & other scanner functions **

USER DEFINABLE CONTROLS

The CE-232 offers four user-definable switches that can be used to control add-ons or other modifications that you may have done to your scanner! Uses for these User Switches are virtually unlimited, but might include turning on/off things like Automatic Tape Recorder Switches; extra memory banks; Data/Tone Squelch and any other of my mods or add-ons that you've developed or acquired. These UserSwitches

are controlled by YOU and, if desired, automatically by the computer using the Script function! (The Script Function is described below.)

(User Switches available for all supported scanners)

==========
THE FOLLOWING FEATURES ARE AVAILABLE ONLY FOR PRO-2004/5/6 SCANNERS

==========

** Easy-to-use AutoLogger feature **

AUTOLOGGER

The CE-232 will AutoLog for unlimited periods of time, any and all activity encountered by the scanner, regardless of the mode. Each -event- (squelch break) is logged to a text file as a data line item containing the following information at a minimum:

CHANNEL: number
FREQUENCY: MHz
MODE: AM, NFM, or WFM
DELAY: status, set or not
LOCKOUT: status, set or not
FUNCTION: Prgm, Man, Scan, Search Up, Search Down, etc
STEP: Search increment, kHz, if applicable
DATE: of event
START TIME: of event
DURATION: of event (seconds)
(and more): several user-definable parameters including S-metering!

Autologging can be turned on or off at will. Autologged files are automatically opened and named with a date/time logo, similar to: 96070812.LOG meaning: 1996, July 8, 12th hour (noon).LOG. Each hour, a new log file is opened and the old one closed & saved.

Autolog files can be AutoProgrammed back into the scanner's memory at will with no manipulation or changes; just the press of a couple of keys! This means that you can do a SEARCH function all night or day while you're away and then at your leisure, program in each new found frequency quite simply, hands-off, in a matter of minutes!

PRO-2004/5/6 feature only

==========

** CE-232 rejects "birdies" and other undesired signals! **

AUTO-REJECT

You can do like I did.....disconnect the antenna; set the ATT switch to the -10 dB position and do a SEARCH from 25 MHz - 1300 MHz with the autolog feature ON. About two hours later, you'll have a file that contains just the BIRDIES in your scanner! Now you rename this file to something like BIRDIE.REJ, and the next time you do a frequency search, you can specify another CE-232 function called AUTO-REJECT, that prevents the scanner from locking or stopping on a "birdie".

But that's not all! You can insert other undesirable frequencies into the BIRDIE.REJ or another *.REJ file, so not only can you EASILY make the scanner forever reject birdies, but also pagers, data channels and other obnoxious signals that you don't want to monitor!!!

PRO-2004/5/6 feature Only

==========

** CE-232 offers a LOOKUP feature for I.D. of signals! **

AUTO-LOOKUP

The CE-232 sports a LOOKUP function which displays your data for a frequency every time the scanner STOPS on an active signal! Your previously prepared AutoProgrammer File will do nicely for this function, and thereforewill display whatever is in your database for that frequency! Great for quick identifications of the signals received by your scanner!

PRO-2004/5/6 feature only.

==========

** CE-232 offers a Script Language to automate scanning! **

AUTOMATED SCRIPTS

And, now comes perhaps the most important feature of all: a very powerful -script language- which lets you automate a series of functions to make the scanner do various things while you're away or not interested in being right there for the operation! In simplest form, you can make a Search & Store function to log everything it hits the first time, but to reject duplicates if hit again! You can make things happen at certain times and stop at other times; and otherwise the Script Language allows you to write your own convoluted functions and procedures! Essentially, this scripting feature is much like a macro function; you write your own ticket! And it's not difficult, either. In fact, many scripts are provided with the program!

PRO-2004/5/6 supported feature (but may work with other scanners)

==========

** The CE-232 has flexible inputs/outputs for the User **

USER-DEFINABLE INPUT/OUTPUT BITS

The CE-232 offers 22-bits of unallocated, user accessible I/O registry. There are 8-bits of Output logic that can be controlled from the CE-232 Script feature simply by setting -low- and -high- in these bits. The implications are enormous considering that a variety of logical operators can be configured to turn various bits on and off, depending on a variety of user defined input data. The status of these user-defined and script controllable OUTBYTES is displayable and recordable by the AutoLogger.

The CE-232 offers 14-bits of Input Logic that can be tested from the Script function. High and low logic (+5v and 0v) can be applied to these input bits from external sources, much like sensors for idiot lights in a car. One application we have developed is for an S-METER!

The AutoLogger can read and store these Input bits, so every -hit- can be associated with a signal strength!

==========

OTHER INFORMATION
==========

The heart of the CE-232 is a non-proprietary computer on a chip made by Motorola (68HC11 family). But the neat thing is that this microcomputer does not contain any firmware or hard programming like others do! Instead, the proprietary software is on the supplied disk and is loaded into the microcomputer chip each time you boot the CE-232 program! This means that we or 3rd parties can develop inexpensive updates on disk can be made available at regular intervals. Other suppliers would have to provide a whole new chip to make upgrades; more expensive to them and to you!!

==========

HOW THE CE-232 IS AVAILABLE
==========

The CE-232 is available in four different ways and forms:

1. As a Kit of essential parts, including a professional printed circuit board; six DIP integrated ciruits; one non-proprietary microprocessor chip & chip carrier socket; and a small handful of parts (resistors, capacitors, diodes, crystal, voltage regulator, etc.) Included is our proprietary program disk, you specify size.

Not supplied are standard DIP IC sockets (highly recommended); solder; wiring; serial cable; input & output connectors nor a project box in which to install the CE-232. The board can be installed in some scanners, if desired, but an external box is much better for most situations.

Included are a very detailed Manual, and Program disk with control program and many supporting files.

2. As an assembled and tested board, ready for you to install in a project box or in the scanner. Comes with the same Manual and Program disk as above.

3. Complete turn-key installation and setup - we do it all.

4. As a totally do-it-yourself project, featured in Bill Cheek's new ULTIMATE SCANNER book with complete instructions and resource guide!

+==========+

Availability is usually from stock on Kits of Parts (Item 1). Assembled and tested boards are also usually available from stock, but inquirefirst. Custom assemblies and installations by prior

arrangements and will be quoted upon inquiry.

==========

TECHNICAL SUPPORT
==========

Doubtful of your abilities, are you? Relax. If you know the difference between a soldering pencil and a welding torch, you can probably do the job. The 100-page Manual takes you step by step to success, and it has been done hundreds of times before you came along.

Yes, people have had problems, most very minor..... But, if you have ANY problem, we will provide Technical Support until you have reach success. It's old-hat to us....we've worked with green weenies and salty experts. We have been able to guide to success EVERY purchaser of the CE-232, who has come to us for Tech Support.

The primary tech support media are either Internet e-mail, or the Hertzian Intercept BBS where there is a special forum and a file area expressly for the CE-232. Some people don't like BBS's or don't have a modem. So support is also available by FAX, Internet e-mail, CompuServe, and if necessary, snail mail. The only medium where tech support is definitely not available is voice telephone.

One, it's too costly to be distracted by the phone, so I don't use it under ANY circumstances, but two: technical support for electronic technology is NOT very effective by voice. The written medium is the BEST and we assure you of timely support when you need it....almost always within 24-hours of your request, if by electronic means.

Sorry....mail takes whatever time it takes, but BBS, FAX, and e-mail get our immediate attention. The bottom line is we won't let you and your scanner flounder because of a few little problems.... though if you follow our instructions, you are not likely to run into any problems that you can't handle on your own. Tech Support is one of our strongest commitments.

==========

CAVEATS & REQUIREMENTS
==========

The CE-232 works with a PC/clone computer with MS-DOS 3.1 or higher. A minimum of 512-k memory is required along with about 3-Mb of free hard disk space. (Operation from floppy disk is possible.)

Operation under Windows 3.1, Windows For WorkGroups 3.11 and Win95 has been tested and proved.

MACINTOSH NOTE: We do not support the CE-232 with Macintosh computers, but we can refer you to those who might. Inquire.

The CE-232 connects to the computer's A or B serial ports (COM1 or COM2 only) by means of a standard serial cable of any reasonable length, say 25-ft or less. The computer's COM port must be capable (and most are) of 9600 baud, 8-data bits, no parity and 1 stop bit: (9600,8N1).

The CE-232 has been tested on an XT/clone, 386SX/16, cx386SX/33, i386DX/33, i486DX/50, i486DX4/100, AMD486DX4/100, AMD 5K86/P90, and Pentium computers with equal success and good results. Hundreds of CE-232's are in operation around the world on a wide variety of computers and operating environments, by professionals and hobbyists, alike.

The CE-232 was designed for the PRO-2004/5/6 series of scanners, but it works to a limited extent with many other scanners. Inquire or see above for the latest.....

The CE-232 works with all known scanner modifications EXCEPT crystal speedups where the Clock Resonator was replaced with a quartz crystal to speed up Scan & Search. Unfortunately, the original Resonator must be reinstalled in order to be compatible with the CE-232. (We can supply them if you lost or broke yours.)

==========

ASSEMBLY & INSTALLATION DISCUSSION
==========

Assembly of the printed circuit board is straightforward and not at all complicated. It takes me about an hour complete the board with no instructions! My 15-yr old (at the time) daughter, Ali, assembled a board in under 2-hours using ONLY the written instructions I had provided her. Her Board worked the first time out.

Three wires are required between the computer and the CE-232, and about 10 to 20 wires from the CE-232 to the scanner are required, dependingon the scanner. These connections are not difficult in most scanners.

For the PRO-2005/6, removal of the Logic/CPU Board from the front panel is required for five of the connections; no big deal, maybe intimidating to the uninitiated, but the instructions are clear.

The most difficult part of the assembly & installation process is fitting the CE-232 board into a project box; mostly a simple mechanical matter. Most of YOU will be more inclined in this area than I am.

If the CE-232 is installed in a project box, then a method must be devised to connect the CE-232 to the scanner. I use DB-25 connectors mounted on the rear of the scanner and then wired within to the required points in the scanner. A standard parallel cable connects between the DB-25 connector on the scanner to a mating DB-25 connector on the rear of the external metal box. Piece of cake that way.

Operation of the CE-232 is a snap! The program is easy to use with pull-down menus and a detailed set of documentation. Much in the way of convenience is built into the CE-232 software and all I can say more at this point is WOW! I am impressed.

==========

WARRANTY & GUARANTEE
====================

The CE-232 is a KIT, even in assembled/tested form. Unless we install

it, we cannot guarantee it like ready-to-run factory merchandise. But

we do offer 5-day/100% and 30-day/80% money-back policies (less shipping & handling) provided the sealed, translucent -bag of parts- has not been opened or tampered and the Kit materials are returned in like-new condition within those periods. This gives you the opportunity to review the Manual and the Program Disk and to make up your mind about committing to the Project. If you commit to it, then we commit to your success via our Technical Support Program described above.

==========

DO YOU HAVE QUESTIONS?
======================

I am open to your questions of what the CE-232 will and will not do as well as anything else that might be related to your uncertainty as to whether or not the CE-232 is right for you. You can communicate with me via the FidoNet SHORTWAVE or SCANRADIO echoes, or by any of the means listed below.

First of all, determine the exact source of the interference. "Your computer" isn't good enough. The interference could be coming from the monitor, the keyboard, the CPU or from anything else that is attached to the CPU.

First determine WHICH subunit generates the emissions. Tune the scanner to the alleged interference, and then disconnect the monitor from both the CPU as well as from the AC socket. What happens? If nothing, then disconnect the keyboard; then the mouse; then anything else attached to the CPU. Last, but not least, then shut off the CPU and see what happens.

Let me know.

That's true enough, except that 15 MHz of spectrum does not include the entire missing bands. We're looking at gaps of:

868.950 - 894.000
823.950 - 849.000

for a total of over 50 MHz of missing spectrum.

Also there is the fact that the "images" that appear in the 1100-1115 MHz band are not especially traceable back to specific frequencies in the cellular bands. So I'd hardly term those "images" as any semblance of a solution.

So how does one obtain the "codes"? I know for a fact that the PROBE doode swears he won't give it out. For their own security, I'd assume the others won't either.

>Actually I can't see what all the fuss is about cellular for anyway.
>I really don't want to listen to who did what to whom down the street
>or someone's receipe for cookies.

Actually, it's not "cellular". It's more that the radio spectrum includes 868.950 - 894.000 MHz and 823.950 - 849.000 MHz, and the conspicuous absense of those bands is unnerving to many free-thinking scannists. Imagine a "hole" in the middle of your 550 - 1600 kHz AM dial after having been continuous tuning there for years and years.

Those are illegal and forbidden by the TDDRA of 1994, so once existing supplies are gone, that's it. GRE stopped production of those converters back in March of 1994. Apparently there is a surplus of "grandfathered" units around, but supplies are drying up.

Michael,

On Mon, 23 Sep 1996 15:58:34 -0400, you wrote:

>I'd like to install an outside antenna to be used with my BC3000xlt.

Good choice. The BC3000 is a great scanner and seems to deal with external antenna signals very well. It keeps interference down to next to nothing. Both near and far signals come through nice and clear in my experience.

>Can I run the cable into a 3-way splitter so that I can use the scanner in
>different rooms, without degrading performance much?
Well... I think you get a full 3dB loss (half signal) for a 2-way split. A three way split would be proportionally more. The 3000 is so nice and sensitive, it would still be acceptable, but why restrict yourself. You might want a 3 way switch instead of a splitter so that you need to choose which chunk of COAX you wanted to use at any time (since you only have 1 scanner to connect up at this time). The loss on a a good switch is typically less than about 0.2dB.

>What is the longest length of coax I should use to avoid experiencing
>significant performance loss?
Depends on the COAX used. I use reasonable quality RG8X which is neither as thick or as loss-free as RG8U but far better than RG58 (the cost is in-between as you would expect). I find 8X to be just fine cable for lengths of up to 50 feet (perhaps longer, I've never really tried it). I think for receive, it might not make too much difference. For Ham transmit, the goal is to keep the cable loss very low.

>Looking through scanner world catalog, I see lots of antennas but how is
>one to decide what works and what is crap?

Ahh... can't help much there. A discone is often discussed as being somewhat good. I use a 1/2 wave 2M Cushcraft antenna that I also use with my 2M Ham station. It's designed for 144-148 peak performance, but the height and construction seem to work wonders on the BC3000 for virtually any range I'm interested in even below 100MHz and above 800. My guess is... if you put it on the roof, any antenna will seem like it works wonders just due to the height and getting it away from objects like your computer, lamps, metal radiators, etc. A friend put up the $17 all-band Radio Shack antenna and, once on his roof, he got excellent results and good range on his 3000.

Take care,

Dave Bernazzani

I don't use a discone, they do not perform to my needs.

I use an AS- MONR-58 as the main antenna, and the other is a Cushcraft
10 element yagi.

I want a scanner which can select by ME programming which antenna port

to use on a per channel basis.

This would allow me to have a 300-454MHz antenna, and 455-512MHz
antenna, and use helical band pass filters to eliminate the 454Mhz
paging section. A real plus at eliminating intermod, in any scanner or
other radio.

>All self-respecting amateur radio operators with official licenses
>from the Federales know that a 75-50 ohm mismatch causes a 1.5:1 VSWR,
>the loss of which is 4%. This equates to a loss of less than 0.2 dB.

True. The loss is only about 1.5:1 - still very respectable
especially compared to the gain you get from using the better cable.
In practice, on any antenna system I've dealt with you aren't going to
have below about 1.2:1 and even that varies through the band you are
working with. The 1.5:1 makes little difference in transmit and
probably won't affect receive that you could tell the difference.

However, 2 things:

(1) Why not use RG8X cable? It's 50 Ohms so it matches well (although
we have already determined that is not a big deal) and it is
reasonably cheap (less than $20 for about 50 feet). It's better than
RG58 but not as expensive (or loss-free) as pure RG8U. Is the 75-Ohm
RG59 that much lower-loss and cost effective?

(2) I see some bashing of the Amateur Radio community from time to
time here in this forum. If someone with an FCC amateur license makes
an incorrect assumption or gives bad information then some assume the
FCC amateur program failed to do it's job teaching the licensee. Or
worse, some may claim that the whole program is just a joke to begin
with.

Not that I care what everyone thinks about the FCC amateur program,
but I just got my license this year and it was not so that I would
know everything there is to know about the radio art. We all realize
that the piece of paper is not the knowledge source. It requires much
time reading, digesting, experimenting and using radio equipment
(which is why I respectfully yield to the knowledge of the many
non-licensed helpfuls in this group). The license for me and many
others is just a beginning - a ticket to experiment on the designated
bands and tinker with antennas, feed-lines, radios, etc. One of the
purposes of amateur radio is to improve technical skills and to
understand through experimentation - not to make radio geniuses.

Oh... sorry about the soapbox and all.

Take care,

Dave Bernazzani

6293. Re: Advice on buying the Bearcat BC9000XLT

Newsgroup: rec.radio.scanner
Date: 1996-09-29 00:00:00 UTC
From: Rich Wells <rjwellsr@vnet.ibm.com>
Message-ID: <324E8A6E.41C6@vnet.ibm.com>
Source record: 221750

Art,
Having owned and used a BC9000 for about six months, I would give the
following review

Positive : tuning dial, alpha-tagging, # channels, channels/bank,
auto-store, search-lockout
Negative : auto-store, AM sensitivity, AM audio quality

The auto-store and search-lockout are great features. However, during
auto-store of 5KHz-step frequency ranges, the poor selectivity of this
scanner shows through(if during the search the frequency 154.965 becomes
active, you'll not only get this frequency, but ALMOST always, the
frequencies on either-side e.g. 154.960 and 154.970). I find this VERY
annoying...that's why I've ordered a Pro-2042 and plan to compare the
two side-by-side and probably sell the loser.
It's also annoying to pick-up cell-phone images during searches of
the UHF military aviation frequency ranges. Some would consider this
a plus...I do not. I do not think there is a mod to restore cellular.
For this you'll have to buy a UBC-9000(the European version) from
someone like Javiation.
I'm a pilot and listen to the VHF aeronautical frequencies A LOT. This
scanner is probably the worst I have owned in regards to AM sensitivity
and signal quality...my Pro-26 ranks just a notch or two above it. Funny,
my R-1 is probably the best AM radio I have owned in terms of sensitivity..
and that's compared to an Icom A-22 which is a dedicated AM transceiver.
So...overall it's a very nice scanner but for what I use it for the
most, it suffers. I think I'll be happier with the 2042. And of course,
your mileage may vary...

Strong signals,
Rich Wells

According to the safety announcements...ANY receiver cannot EVER be used...not after 10 minutes after t/off and 10 min prior to landing like computers and other things are...NO receiver cannot be used....The point is mute re scanners...THEY CANNOT BE USED...and all the airlines have the same rule, at least in the USA...

>So why did you have to start a big ol' snit? Why not just ask?

Because that is apparently the only way to get all the facts in here.

Ok Bill, I'm asking: Some radios use actual oscillators for the local osc. Most scanners that I know of use frequency synthesis. How exactly does this work? I know it's a microprocessor controlled event, but what exactly generates the osc voltage?

>What would you LIKE for it to be? Do you think we're done with
>cables? (Not.) Your cousin just unloaded a bunch of silly stuff
>about the effects of ultraviolet on cables. Do you think he's right?
>
Don't know. I've never had a cable up long enough to get any significant UV. I'm either changing the antenna or changing the cable, or both.

Tyler

6297. How to decode digital FM SCA data?

Newsgroup: rec.radio.scanner
Date: 1996-09-29 00:00:00 UTC
From: "G. Tong" <gtong@bpsom.com>
Message-ID: <324E9D53.6C3C@bpsom.com>
Source record: 221754

Numerous demodulated FM SCA signals here (the ones that aren't Muzak) appear to be some form of digital data (stock quotes, maybe?), but feeding this data directly into my PC's COM port shows only gibberish regardless of the baud rate chosen. How can I decode this data into something readable? Please post solutions or send via e-mail. Any knowledge received will of course be used "for informational purposes only." :-)

Try clamp on ferrite cores on the cords:
1. at the back of the keyboard
2. at the back of the case:
a. on the printer cable
b. on the video cable

Make sure your system is grounded correctly

cheers

6299. Antenna Preamps

>from a practical standpoint this has no effect on my ability to
>receive the transmission, but I am confused by their tendency to drop
>the 5 kHz.

This is due to the fact that when they went from 50 KHz to 25 KHz about 20-25
years ago, radios only had (and many still have) only 2 digits
to the right of the decimal.
So the radios would be internally modified and capable of tuning in 25 KHz,
but the display would show only 2 digits to the right of the decimal, so
frequencies will be .02=.025, .07=.075.
They are also listed as such on maps etc.
We only have to remember the 3rd digit when entering them into a scanner.

Regards
Peter

Why don't you check out the ScanWare Associates Web Site. You can
download the FCC Database for the whole state of Ohio and a super
retrieval program to go with it. It's all freeware.

Enjoy,

This is partially correct. They also use
terrain-avoidance RADAR to make sure they don't have close
encounters with mountains, etc. Over elevated terrain, your
"pressure altitude" can intersect with the ground if the
local pressure is too far off your altimeter setting.

I have a need for a directional finder for some frequinces from my Pro 26 scanner. I have a scope, scanner and some other basic instruments. All I need is some help in designing the auto directional finder such as in an aircraft. The frequences in question are in the 72 Mhz range. We have been getting interference at our R/C field and I would like to track it down to see if its spash-over or intentional interference. Any help will be greatly appreciated.

Thanks
Joe.

> unidirectional in order to nail down which of a close
>grouping of antennae is the one broadcasting?

You could connect a directional antenna (e.g., a multielement
Yagi beam) to the frequency counter, than rotate the
antenna, pointing it at the various transmitting antennas.

You might benefit from placing an adjustable attenuator between the
antenna and counter and so you could reduce the strength
of the signal. If the signal to your counter is too
strong, the counter will read the frequency regardless of where
the beam is pointed.

Andrew,
Call Larsen Antennas at 1-800-426-1656 and ask for a catalog. They
have a wide selection of mobile and base antennas. Or, you can do like
I did and visit your nearest commercial 2-way radio shop and see what's
in stock. I'm running an Antenna Specialist 455-470 MHz NMO-connector
5/8 over 1/2 collinear mobile with 4-5 dbi gain. I can reach 5 miles
and more to my home base with 2 watts in a suburban environment. My
base antenna is 17 feet high.

Wrong. It's not usually illegal to own a scanner capable of receiving
cell phone calls as long as it was made before the ban took effect. It
IS illegal in general to listen to cell phone calls no matter if the
scanner is legal or not. It is illegal in general to manufacture new
scanners capable of receiving cell phone frequencies.

> dicko@albanyis.com.auI have a pro25 and I like it a lot.
It goes from 30 mhz to 960 mhz.
Tehcnically, it is not supposed to get cellular, but it does.

Mine has a 2 year warranty and I've had it for 6 months.
I'm sure you've read the specs, so I won't elaborate.
If not I can send them to you.

I like it so much that I want to spend about $500 for a new one.
I've really gotten into it.
So I'm looking to sell mine for $125. It retails for $269 I think.

It pulls in lots of frequencies

Bill Cheek wrote:

> Well, the best YOU can do is state a set of call letters. My degrees
> do not confer anything resembling a call sign. Neither does my 1st
> FCC Phone with Ship Radar Endorsement.

BUT your commercial (FCC phone) would have a "license number"
rather than a callsign. EVERY Radiotelephone (or telegraph too) issued
by the FCC has a license number. Due to slight differences, your
license
number may be listed in different locations. On my General
Radiotelephone
(which it what replaces BOTH the First & Second class radiotelephone)
the
license number is right above where I signed my name.

Acutally Billy, that is why I think you are lying about having
a FCC Radiotelephone license because they made that change about 10
years ago (maybe more) at the same time they made the license
lifetime. So you would now have a General Radiotelephone if you
actually ever had one to begin with AND kept it current AND it was not
revoked in that little BUST the FCC made on you with your illegal high
power CB fiasco.

So it would be kind of
> difficult to "demonstrate" it.

Bull, just give the license number OR scan it & post it to the NG
like I did your postcard.

> As it is....I stated mine.....

No you have never given anything to support it.

> Now the thing is......your hambone ticket and my degrees and
> professional licenses put together along with five bucks *might* get
> us a bus ride somewhere in the San Diego region.

You're right there. Even my commercial license & my degree does
not make a good tech (or engineer), it takes just plain knowledge &
ability. You have no arguement from me there.

> Time will be the test, though. For example, as people look at their
> coax that's been out in the sun for the last 10-20 years and see that

Doesn't happen here either. I didn't have insurance 2 years ago and they treated me. My mom works up in Portland, they don't turn away the gang bangers who get shot. Where did you ever get the idea that US Hospitals won't treat you without insurance??

> >And GM, Ford, and Chrysler were nice enough to let you build several

> So nice in fact that you can buy a car in Canada cheaper than you can
> in the U.S. (even after the exchange rate)!

Beg to differ. I have a sister in Ottawa who is waiting to buy a car until they move to the states because it's cheaper. Plus they can get a job in the US. There aren't any in Canada. To prove the point, look at the job page in the Ottawa paper, 2 pages! Here in Corvallis, Oregon (pop 40K) we have 6.

I'm not trying to slam Canada, but it's pretty funny to see Canandians try and slam the US when they are far from perfect.

> advance!

The search feature enables you to scan all the frequencies between upper and lower limits you determine.

To search, stop the scanner on a channel, then enter the lower frequency + "limit" and then the upper frequency
+ "limit." Then press "search" and you should be scanning all the freqs between.

You should note that this process erases the frequency stored on the channel you stop at.

Matthew Kleinmann wrote:
Also, the scanner has a
> search button on it, but I have yet to be able to get it to do
> anything. Anybody know how that works or what she does?

To search between frequencies, you have to manually stop the scanner at a channel, then enter the lower
frequency and press "Limit," then the upper frequency and "Limit" again. Press search and you should be able to
scan between the upper and lower limits you set.

Have no idea about the board you found, unfortunately.

6337. radar detectors as scanners?

>>Has anyone had any expience with the Uniden GMR100. What is its range
>>within the city? Is it actually "one full mile" as Uniden claims?

Range is from fifty feet to a few hundred yards in a major city
situation. AND, since it does NOT have CTCSS capability, it cannot be
used for any serious GMRS work on repeaters.

ALSO - NOTHING that Radio Shack currently offers is usable for serious
GMRS communications.

>well >know established fact. I am surprised that a "engineer" does not know
>this.

You know "old wive's tales". I know the facts. And the facts are
that the characteristic impedance, velocity factor, and loss factor of
a cable is not a function of the outer insulation. Therefore, quite a
bit of weathering and damage can be incurred to the outer layers of a
cable without impacting its performance.

Like I said, RG-8, RG-8x, RG-59, RG-6, Belden 8214 and 9913 and many
other cables are well known to last 20-years or longer. The only
conclusion is that your ham club and mentors have misindoctrinated
you.....

Unless, of course, you'd care to state specifically what it is that
you think you know......and then we can deal with that. Otherwise, it
stands that the vital characteristics of a cable are not significantly
dependent on the outer jacket so long as there is any integrity in the
first place.

The performance variables of a coaxial cable include the resistance
and inductance of the center conductor and shield; the parameters of
the dielectric insulation between the center conductor and shield; the
percent coverage of the shield; the diameter of the center conductor;
the inner diameter of the shield; the composition of the shield and
center conductor; and of course, the length of the cable.

Yes, Mr. Mackey, I am an engineer. You are a bedpan changer for a
hospital.

I mean the devices aimed to be used for example by a person with some kind of a desease when attacks could happen. The person switches on the radio-trinket and another person with an appropriate receiver hears the signal and has at least the opportunity to detect the direction to the person under attack.

I would like to know the polarization orientation for TV transmitting antennas, both VHF and UHF. It would appear that they are vertical from those that I have seen.

If this asssumption is true- why are receiving antennas horizonally polarized?

My last comment is that a reasonably calibrated hobby grade frequency
counter is suitable for making the not so necessary oscillator
adjustment. Even at a difference of a few hundred Hertz, it is hardly
detectable in AM and FM. Why would somebody need to calibrate the
osc. to a degree of accuracy that is not necessary ?
You're the one that insists that it is "layman" hobbiests who you are
dealing with not lab technicians seeking high resolution accuracy.

Intrusional risky methods of calibration certainly don't outwiegh the
conventional use of a Radio Shack or OptoElectronics frequency counter
in my books...especially in this case.

From: pleines@stars.gsfc.nasa.gov
Message-ID: <52om26$5a7@post.gsfc.nasa.gov>
Source record: 221580

I have an AR-8000 + accessories for sale. I'm getting out of the scanning hobby, and no longer use this radio. The scanner is in excellent condition, and is only 1 year old--I've used it for approximately 6 months and its just sitting around. Here's the package:

1. AR-8000 scanner, with supplied ac adapter, cigarette lighter adapter, rubber-duckie antenna, opto scout interface, manual & box

2. INF-8000 computer interface (incl. manual)

3. Scancat software (disks + manual)

4. Radio Shack 12V regulated power supply

5. Radio Shack discone antenna (incl. all mounting h/w)

The scanner has been frequency-restored--no blocks in coverage, and I have the receipts for the scanner (from EEB). I'm asking $600 for the lot, and will ship CONUS at my expense. For details, feel free to contact me at:

pleines@stars.gsfc.nasa.gov

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, airplanes, armored cars, trains, taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air

Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and

the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove.net

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - | (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com | or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The 1996 editions contain selected business listings, too, although callsigns are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which

gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

The Scanner Club is the name of a bimonthly magazine published by Les Mattson. It is a successor to the Northeast Scanning News and is the official publication of The Scanner Club, a not-for-profit club organization. TSC's main strength is local frequency information, including CTCSS codes. Sample issues are $4 each. A yearly membership costs $24.95 and includes 6 issues. Write to The Scanner Club, PO Box 62, Gibbstown, NJ 08027 for more information.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US

Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to

use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over | 500 hobbyists devoted to scanners and scanning. It's called | "scan-l" and for more information, read: |

http://www.uark.edu/~plaws/scan/scan-l.txt |

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago

chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (630)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1996 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges. The phone number for repair is also (800)297-1023.

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. | (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or | ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom

IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is

known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $13. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies. The 1996 edition contains selected business frequencies, too, but callsigns are listed only for local government and public safety licensees.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp. A 3rd edition is expected soon and will be available from Grove Enterprises for about $30. This second edition is crammed

full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350

Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined

the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a

local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's

transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. Although UHF versions were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

TABLE 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

TABLE 2. Plectron 700 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. You | can also get Plectron repairs and parts from: |

Northeast Communications |
4 Oak Ridge Rd |
Newfoundland NJ 07435 |
201-697-8804 |

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
60 old and new scanner radios and monitor receivers. Other
topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase

most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Grove Enterprises (Brasstown, NC) and Radio Shack repair scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. | (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or | ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units

unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 , Bearcat BC-101 , and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot

on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.
Anaheim, CA 92801
tel. 714-991-1580

International Crystal Mfg Co.
11 N. Lee Ave

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews of these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Oct 1996 - Radio Shack PRO-2046 mobile |

Note: Reprints of Monitoring Times articles are available for $2.00 each (plus self addressed stamped envelope) from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this $2.00.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage | super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features | than other radio. DTMF reader and RS-232 interface | included. Multiple settings for IF and AF selectivity, | attenuator, AGC, deemphasis, etc. Negatives include low | contrast LCD display and difficult user interface. NFM | squelch closes slowly, causing noise burst at end of each | NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of

mixed band frequencies. Great radio, otherwise. |

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan

delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel

or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units.

Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto

Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC230XLT (Uniden): See BC220XLT.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF,

but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to | use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size.

Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels.

Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission. See September 1996 Monitoring Times for modifications.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit

room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1995 vintage. Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1984 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn

on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an

optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

TABLE 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a

task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP

transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

6365. Improve the Squelch in Your Monitor Receiver

Newsgroup: rec.radio.scanner
Date: 1996-09-30 00:00:00 UTC
From: parnass@bell-labs.com

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

TABLE 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Comments
Radio Shack PRO-24	R35 33K	replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K	try 220K.
Radio Shack PRO-2004	R148 47K	remove R148 or replace with 220K.

	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)

>At least they can demonstrate some kind of proof,

How? You haven't demonstrated any sort of "proof" of your license.

> as you have NEVER been able to demonstrate proof of your engineering degree

You mean "degrees"? :-)

>or FCC commercial license.

Well, the best YOU can do is state a set of call letters. My degrees
do not confer anything resembling a call sign. Neither does my 1st
FCC Phone with Ship Radar Endorsement. So it would be kind of
difficult to "demonstrate" it.

As it is....I stated mine.....same as you stated yours. I could also
set up my newsgroup reader/editor under the same alias you use...or
any other one from the ham call book....and flaunt my United States
Government issued call sign.....which would prove nothing.

Now the thing is......your hambone ticket and my degrees and
professional licenses put together along with five bucks *might* get
us a bus ride somewhere in the San Diego region.

So neither yours nor mine are worth much of anything. Thusly, there
has to be a different set of criteria by which to measure what we're
made out of. Best thing I can think of is to talk about what we know
and be as specific as possible. No matter what, those "in the know"
will know. Those not in the know....still won't know.

Time will be the test, though. For example, as people look at their
coax that's been out in the sun for the last 10-20 years and see that
its integrity is still intact.....will KNOW that you are fuller of
shit than a Christmas Goose.....which is widely known anyway....

Soooooo, Mister John Mackey, let's you and me get down and do some
technical jousting for REAL. Not insults and slander; rather nitty
gritty technology where......I will clean your clock; sharpen your
plow; eat your lunch; dust your britches; pick your pockets; nip your
lips; frap your jowls; and kick your ass from here to Kingdom Come.

Your ONLY claim to fame is to play dirty. But if you think different
and would like to really PROVE it, what say let's play clean and
square and see where your ass lands?

<giggle> (You ain't got a hair in your arse, kid.)

>from adjacent channels. Thanks in advance for your help.

The Scantenna will tend to be "peaky" across its bandwidth, meaning it will have some gain here and there in its performance band. It will have zero or even negative gain in other portions of its bandwidth.

A discone is relatively flat at 0-dBi gain across several octaves of its bandwidth.

Six of one and a half-dozen of the other, but if your interests are many and varied, then I'd go with the discone. If your interests are strictly confined to the areas you mentioned above, then then Scantenna might be the better choice. Neither one will bestow any great blessings upon your head and shoulders, but no evils, either.

Take your pick.

Yes.

> Are they worthwhile?

Generally speaking, no.

>I Have seen the GRE and ACE GW2 units advertised. Are either of
>those two units any good, or are there better units on the market?

The best of the bunch is the J.I.M. series (M-75, M-100, M-200) sold
by EEB/EDCO in Vienna, VA.

In general, however, preamps tend to raise the noise floor of the
receiver; lower the dynamic range; overload the sensitive front end;
and cause more problems than they resolve. There are times when they
can perform the intended purpose, but those times are not the rule;
rather more the exception.

Yeah, right. Just like, oh no, don't listen in to cell phone calls or portable phone calls or Big Brother will surely get you.

Sure, CB amps have been illegal for decades, and I DO mean decades as I was into CB back in the early 60's when 5 watts was the norm. The FCC, due to budget cuts and disinterest, has abandoned almost entirely, enforcing the CB rules and regulations. It's not manageable anymore. They appear to be focusing on the big time violators with large overpowered stations that just won't quit and pushing RF's into every home within a mile or two.

As for have a little "pusher" attached to your mobile unit or base station for those times the jerks won't cut their own power, I personally see nothing wrong with it as along as you do not cause interference to your neighbor's TV or other electronic devices.

I had a 400 Watter once and every time I fired it up (tubes had to warm up first), the lights in my apartment would dim almost out and I burned up my cheap antenna.

Before people start jumping on what's illegal or not, look at your scanner radio and see if it's able to monitor cell phone frequencies. If it can, YOU are also illegal. So leave it alone unless it personally bothers you or interferes with your quality of life, if you have a life at all.

As an outsider, my image of the area is that everything was up-to-date in
Kansas City, and that they're gone about as fer as you can go.

For this reason, perhaps there should be more radio stores in Kansas
City.

Why do you say that? I go to pretty extreme efforts to answer
questions addressed to me.

>Ok Bill, I'm asking: Some radios use actual oscillators for the local osc.

All radios do......

>Most scanners that I know of use frequency synthesis. How exactly does this
>work? I know it's a microprocessor controlled event, but what exactly
>generates the osc voltage?

A VCO. (Voltage controlled oscillator). The VCO is controlled by the
CPU. The PLL (phase locked loop) contains a master reference
oscillator to set the standard and the loop keeps it locked to the
established standard. The VCO freq is mixed with the loop frequency
to produce an L.O. injection frequency for the mixer.

>>What would you LIKE for it to be? Do you think we're done with
>>cables? (Not.) Your cousin just unloaded a bunch of silly stuff
>>about the effects of ultraviolet on cables. Do you think he's right?

>Don't know. I've never had a cable up long enough to get any significant UV.
> I'm either changing the antenna or changing the cable, or both.

Ok. But you're a ham. So ask around the nets for others' experiences
with the basic cables like RG-8, RG-58, RG-8x, Belden 8214 and 9913.
Find someone whose cables have been out for several years.....and ask
about any apparent degradation.

Ask one. Ask a dozen. Ask a hundred..........

Easy enough.

>RG58 but not as expensive (or loss-free) as pure RG8U. Is the 75-Ohm
>RG59 that much lower-loss and cost effective?

Yes. Here are the loss factors per 100-ft for cables at 1000 MHz:

RG-58 22 dB Hobbyist
RG-8x 13 dB grade
RG-8 12 dB coaxial
RG-59 11 dB cables
RG-6 8.5 dB
Belden 8214 7 dB
Belden 9913 4.5 dB
==========
Andrew LDF2-50A 3.5 dB Commercial
Andrew LDF4-50A 2.3 dB Grade
Andrew LDF5-50A 1.5 dB Cables

The Andrew cables are "hardline" and not generally suited for
hobbyists due to expense of not only the cable, but also the special
connectors that are required.

>(2) I see some bashing of the Amateur Radio community from time to
>time here in this forum.

I don't. I do make references to certain hams who come off as being
professionals, though.

>If someone with an FCC amateur license makes
>an incorrect assumption or gives bad information then some assume the
>FCC amateur program failed to do it's job teaching the licensee.

Well, not really. It's more a matter of the casual assumption that
all hams are highly trained pro's.....most untrue.

>Or worse, some may claim that the whole program is just a joke to begin with.

Oh, no....not me, anyway. Hams pretty well single-handedly developed
radio for what it is today. It's just that a lot of radio pro's are
also hams....which helps.

>Not that I care what everyone thinks about the FCC amateur program,
>but I just got my license this year and it was not so that I would
>know everything there is to know about the radio art. We all realize
>that the piece of paper is not the knowledge source.

Some don't realize that. Those folks think it's the paper that counts.
That is the problem.

>Oh... sorry about the soapbox and all.

No problem here. Ain't a thing wrong with a soapboax so long as it
doesn't crush under your weight.

Take five minutes to read this and it WILL change your life.

I just read an article in an internet newsgroup describing how
to make $50,000.00 in only one month from a $5.00 investment.

Of course I thought this was rediculous ,or some type of pyramid.
I talked it over with my family, an attorney, and my friends, and
they all agreed it was some sort of scam.I hate scams because
usually someone gets burned, and I didn't want it to be me!
I blew it off for a few weeks then saw another one in a
newsgroup I go to alot and thought, "Maybe this is legitimate!".
Besides, whats $5.00 , I spend more than that in the morning on
my way to work on coffee and cigs for the day.

Well, two weeks later,I began recieving money in the mail!
I couldn't believe it! Not just a little , I mean big bucks!
At first only a few hundred dollars, then a week later, a
couple of thousand , then BOOM . By the end of the fourth
week , I had recieved nearly $47,000.00. It came from all
over the world.And every bit of it perfectly legal and on the
up and up. I've been able to pay off all my bills and still had
enough left over for a nice vacation for me and my family.

Not only does it work for me, it works for other folks as well.
Markus Valppu says he made $57,883 in four weeks. Dave Manning
claims he made $53,664 in the same amount of time. Dan Shepstone says
it was only $17,000 for him. Do I know these folks? No, but when I
read how they say they did it, it made sense to me. Enough sense that
I'm taking a similar chance with $5 of my own money. Not a big
chance, I admit--but one with incredible potential, because $5 is all
anyone ever invests in this system. Period. That's all Markus, Dave,
or Dan invested, yet their $5 netted them tens of thousands of dollars
each, in a safe, legal, completely legitimate way. Here's how it
works in 3 easy steps:

STEP 1.

Invest your $5 by writing your name and address on five seperate
pieces of paper along with the words, "PLEASE ADD ME TO YOUR MAILING
LIST." (Inthis way, you're not just sending a dollar to someone;
you're paying for a legitimate service.) Fold a $1 bill, money order,
or bank note insideeach paper, and mail them by standard U. S. Mail to
the following five
addresses:

1. Stephanie Glandon
10 Crescent Dr.
Aylmer, Quebec J9H 1T1
Canada
(key contributor)

2. Bill Johnson
31 N. Prince St.
Millersvillle, PA 17551

3. Remi Zaragoza
University of Puget Sound
Seward #205
1500 North Warner
Tacoma, WA 98416
(highly reliable source! University graduate)

4. Stewart McLeod
39 Dorchester Dr.
Bramalea, Ontario
Canada
L6T-3C8
(very responsive)

5. Vladimir Taldenko
30/54 Prokofyev street
Sumy 244024,Ukraine

STEP 2.

Now remove the top name from the list, and move the
other names up.This way, #5 becomes #4 and so on.
Put your name in as the fifth one on the list.

STEP 3.

Post the article to at least 200 newsgroups. There are at
least 17000 newsgroups at any given moment in time.
Try posting to as many newsgroups as you can.Remember
the more groups you post to, the more people will see your
article and send you cash!

STEP 4.

You are now in business for yourself, and should start seeing
returns within 7 to 14 days! Remember, the internet is new
and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 200 posts I made, I got back 5 responses.
Yes, thats right,only 5. You make $5.00 in cash, not checks or
money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 200 additional postings with your name at #4, 1000 postings.On average then, 50 people will send you $1.00 with your name at #4,....$50.00 in your pocket!

Now these 50 new people will make 200 postings each with your name at #3 or 10,000 postings. Average return, 500 people= $500. They make 200 postings each with your name at #2= 100,000 postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 200 postings each with your name at #1 and you get a return of $50,000 before your name drops off the list.And that's only if everyone down the line makes only 200 postings each! Your total income for this one cycle is $55,000.

From time to time when you see your name is no longer on the list, you take the latest posting you can find and start all over again.

So thats it. Pretty simple sounding stuff, huh? But believe me, it works. There are millions of people surfing the net every day, all day, all over the world. And 100,000 new people get on the net every day. You know that, you've seen the stories in the paper. So, my friend, read and follow the simple instructions and play fair. Thats the key, and thats all there is to it.Print this out right now so you can refer back to this article easily.Try to keep an eye on all the postings you made to make sure everyone is playing fairly. You know where your name should be.

REMEMBER....HONESTY IS THE BEST POLICY.YOU DON'T
NEED TO CHEAT THE BASIC IDEA TO MAKE THE MONEY!
GOOD LUCK TO ALL,AND PLEASE PLAY FAIR AND YOU WILL
WIN AND MAKE SOME REAL INSTANT FREE CASH!

Since you're playing semantics...

The ownership of a radio capable of receiving cell-phone frequencies
is not in as of itself illegal. The usage of such a radio _in_

order_to_receive_cell_phone_calls_ would, indeed, be illegal.
Remember, the FCC and the ECPA did not retroactively ban all
pre-exisiting radios that are capable of receiving cell-phone freqs.
They only banned the mfr. or importing of such radios after the April
deadline a couple of years ago. Nowhere was it stated that radios
could not be capable of receiving the freqs. Listening to the freqs,
though, is taboo.

Your serve. ;-)

(Don't get too hyped up- I'm not flaming you!!! :-)

cjs7@juno.com wrote in article <52hprj$kl5@krypto.zippo.com>...
> Does anybody know why on Airline frequencies when they say things
> along the line of "Atlanta Altimiter is 2990" they actually mean the
> barometric pressure is 29.90 inches?? I know that is what they mean,
> Iwas just wondering why?
> please respond by e-mail to cjs7@juno.com

I'm not a pilot, but I flew as a passenger in a small plane for a couple of years doing traffic reports...soooo, here goes:
The pilot explained to me that the altimiter changes with changes in barometric pressure...as you go higher, lower pressure, and the dial registers this, etc... This is a very exact gradient between barometric pressure and (vertical) distance, so if you know the exact barometric pressure at a point on the ground near your location (and also know that point's distance above sea level) you can accurately know your altitude within a few feet. Altimiters are adjustable, and have a seperate setting on the face (that looks like an odometer) that you set accordingly when your local airport gives you the "altimiter setting."

Hope this makes sense.

Jay

6391. Need help with NJ call sign & freq.

Newsgroup: rec.radio.scanner
Date: 1996-09-30 00:00:00 UTC
From: alanoue@shrsys.hslc.org
Message-ID: <30SEP96.22163387@shrsys.hslc.org>
Source record: 221614

I've been monitoring 164.100 in Newark NJ area for a while and will hear a brief comm. every so often but nothing really telltale.
Today I heard a base use the call sign KSJ 920 or 930.
This call sign seems sort of simular to a railroad or airport ground freq.
But the the freq. itself seems more govt. (I've seen it atributed to USSS, FBI, Customs, and heck even N.E.S.T.).
Any ideas?
Thanks,
Phil

I think you're on to something here, but Bill Cheek's comments that follow are also something to consider seriously; the man knows what he's talking about. On the other hand, don't lose heart. I still believe in capitalism, and while there's NO doubt that the scanner market is truly sales driven, a scanner like the one you describe WOULD sell, and that might possibly be the way to go after it! Don't give up the dream; some regional manager somewhere just might "push it up the line". Radio Shack is actually somewhat receptive to ideas like yours, although they are focused on the overall market.

Scott

Gee Pat....where is your sense of sensibilities residing?

It's not as if they force themselves on you. You just
look at their addresses and then you look at subject matter
and you know what is going to be the topic of your IRE.

Do you know what a KILL FILE IS?

You want info about scanning, then put the offensives in
the KILLFILES and allow reality to continue. You will
not have to be tempted to "view them just to see if they
have mended their ways" and then feel "abused" and
"offended" because this week they choose not to be
as you want them to be.

Why not just be mature about it and acknowlege that the
NET IS ANARCHY and your protest ain't going to change
how the world works: adjust and grow and fit your
reading needs to suit you as to what you don't want to
be bothered with.

Make a better world by eliminating the addresses you are
offended by....it's your choice. This way you cannot blame
them ... that is a COP-OUT.
